1 Introduction

This document presents the results of supplemental site investigation, system performance and semi-annual groundwater monitoring activities conducted at the former North Carolina Department of Transportation (NCDOT) Asphalt Testing Site #6-48 in Pittsboro, Chatham County, North Carolina (the Site) between January 1, 2012 and June 30, 2012. The Site location is illustrated on Figure 1.1. NCDOT is the owner/operator of a groundwater extraction and treatment system at the Site that provides hydraulic containment and removes dissolved chlorinated volatile organic compounds (VOCs) from groundwater. The property is owned by S.T. Wooten Corporation and operates as an asphalt production facility with an active on-Site laboratory. The NCDOT has never owned or controlled the Site. The remediation system and monitoring network include the following components:

- Groundwater extraction wells (RW-1 and RW-2).
- An air stripper and granulated activated carbon treatment system that discharges treated water to an unnamed tributary of the Haw River under a National Pollution Discharge Elimination System (NPDES) Permit.
- Soil vapor extraction (SVE) and air sparge (AS) wells for treatment of shallow groundwater.
- Twenty-two monitoring wells (48MW-1, 48MW-2, 48MW-3, 48MW-4R, 48MW-5, 48MW 10, 48MW-11R, 48MW-12, 48MW-13, 48MW-14, 48MW-15, 48MW-16, 48MW-17, 48DW-1, 48DW-2, 48DW-3, 48DW-4, 48DW-5, 48DW-6, 48DW-7, 48DW-8, and 48SVE-01). Monitoring wells 48MW-8 and 48MW-9 were reportedly destroyed prior to January 2003 (S&ME, Inc. [S&ME], 2003). Monitoring wells 48MW-6 and 48-MW-7 were permanently abandoned during April 2007 (ARCADIS G&M of North Carolina, Inc. [ARCADIS], 2007). Wells 48DW-6, 48DW-7, 48DW-8, and 48SVE-01 were installed during March 2012.
- Stream monitoring location 48SW-1.

1.1 Site Background

The NCDOT periodically conducted asphalt testing at the Site in an asphalt testing laboratory owned by S.T. Wooten. S.T. Wooten Company currently uses the Site as an asphalt production facility. The approximate location of the former S.T. Wooten testing laboratory is illustrated on Figure 1.2. In addition, Figure 1.2 shows the current layout of the asphalt plant and the location of the remediation system including the AS points, SVE points, recovery wells, groundwater monitoring wells, and surface water monitoring point.

The testing procedures employed at the former S.T. Wooten laboratory involved the use of chlorinated solvents, which may have included carbon tetrachloride (CT); 1,1,1-trichloroethane (1,1,1-TCA) and trichloroethene (TCE). In 1989, a Memorandum of Agreement (MOA) between NCDOT and the North Carolina Department of Environment and Natural Resources (NCDENR) was entered to conduct site assessments at 72 former NCDOT asphalt testing sites. Additional MOAs dated July 1996 and February 1999 were issued to establish a list of target compounds and to address the preparation of Comprehensive Site Assessments (CSAs) and Corrective Action Plans (CAP) at a selected number of these sites, including the Site.

The target compound list for the NCDOT sites, defined under the MOA, includes 12 chlorinated solvents associated with the former asphalt materials testing activities including the three primary compounds (CT; 1,1,1-TCA, and TCE) and associated daughter products (1,1-dichloroethene [1,1-DCE]; 1,1-dichloroethane [1,1-DCA]; trans-1,2-dichloroethene [trans-1,2-DCE]; cis-1,2-dichloroethene [cis-1,2-DCE]; vinyl chloride; chloroethane; chloroform; methylene chloride; and methyl chloride). Non-target compounds are other VOCs on the United States Environmental Protection Agency (EPA) Method 8260 target compound list that, if present, may be associated with non-NCDOT related releases.

ARCADIS performed a CSA to assess the extent of the chlorinated hydrocarbon contamination in the soil and groundwater. The CSA report (ARCADIS, 1997) was submitted to the NCDENR in June 1997. In September 1998, NCDOT contracted with S&ME to prepare a CAP. On September 7, 1999, S&ME submitted to NCDENR a CAP recommending monitored natural attenuation (MNA) as the remedial alternative. The North Carolina groundwater quality standards established in Title 15A of

the North Carolina Administrative Code, Subchapter 2L, Section 0.202 (2L Standards), were selected as the remedial goals in the CAP.

In a response letter dated January 14, 2000, NCDENR required, in addition to MNA, active remediation of "hot spots" in the soil and groundwater to remove source-area contamination. S&ME submitted a revised CAP on June 30, 2000, (S&ME, 2000) recommending soil vapor extraction, air-sparging, and groundwater pumping to remediate the "hot spots." NCDENR approved the revised CAP in a letter dated July 19, 2001, but required the installation of two additional monitoring wells, collection of samples from the potable water supply wells surrounding the Site, and performance of quarterly monitoring after the remediation systems were started. The two additional monitoring wells (48MW-4R and 48MW-11R) were installed on March 31, 2004.

As approved in the CAP, S&ME installed and began operation of AS and SVE systems to remediate impacts in the shallow aquifer in October 2002. The groundwater treatment system (GWTS) was designed to remove contaminants from groundwater and to influence the hydraulic gradient in order to prevent migration of contaminants off-Site by pumping groundwater from two recovery wells (RW-1 and RW-2). The GWTS was started on September 11, 2003.

The average TCE (240 micrograms per liter [$\mu\text{g}/\text{L}$]) concentration in the groundwater treatment system influent between 2004 and 2010 was more than twice that observed in well MW-1, which historically had the highest impacts among the Site monitoring wells. The disparity between the average influent concentration and that observed in well MW-1 suggested a residual source area within the capture zone of the groundwater recovery system.

In April and November 2010, AECOM North Carolina, Inc. (AECOM) performed additional site assessment activities including soil and groundwater sampling and analysis for VOCs. One of the primary objectives of the Site assessment was to identify potential VOC source areas near the following:

- Former S.T. Wooten Asphalt Testing Laboratory and Septic Tank Area;
- Current Asphalt Testing Laboratory Area;
- Former Potable Water Well Area (PW-1); and
- Septic Tank Percolation Area.

The details of the additional assessment activities are presented in the 2010 Site Assessment Report (AECOM, 2010). In summary, two out of three NCDOT target compounds (CT and TCE) were detected in multiple soil samples above the Inactive Hazardous Sites Branch (IHSB) Protection of Groundwater Soil Remediation Goals (POG). TCE was also detected above its IHSB Preliminary Health-Based Soil Remediation Goal in multiple soil samples. The horizontal extent of soil impacted with TCE above its POG covers an area of approximately 8,600 square feet. TCE impacted soil extends at least to depths of approximately 25 feet below ground surface (bgs) in the central source area. However, elevated TCE concentrations in groundwater immediately down gradient of the source area suggest TCE impacted soil extends to the water table (approximately 35 feet bgs). The investigation also included installation of three additional groundwater monitoring wells (48MW-16, 48MW-17 and 48DW-5) to evaluate the horizontal and vertical extent of groundwater impacts.

The results of the 2010 soil and groundwater investigation indicated the area of highest soil impacts is located near the former asphalt testing laboratory and outside the AS/SVE system treatment zone. In addition, the groundwater pump and treat system has effectively lowered the water table of the surficial aquifer below the screened interval of the air sparging wells. Consequently, the AS and SVE treatment systems were shut down on August 12, 2010.

In April 2012, S.T. Wooten installed an additional water supply well (48PW-3) approximately 500 feet north of monitoring well 48MW-10. The new water supply is approximately 300 feet deep and capable of producing up to 50 gallons per minute. The well was installed as an industrial water supply well for dust suppression or a proposed concrete production facility (Butch Lawter, personal communication). Between March and July 2012, AECOM conducted supplemental investigation activities at the site. These activities included:

- installation of three deep bedrock monitoring wells (48DW-6, 48DW-7 and 48DW-8) to provide vertical delineation of the groundwater plume;
- installation of one SVE/dual phase extraction (DPE) well and three multi-level soil vapor monitoring points (VW-1, VW-2, and VW-3) to be used for SVE pilot testing;

- borehole geophysical surveys of 48MW-8 and the S.T. Wooten supply well installed in April 2012 (48PW-3); and
- sampling of two down-gradient private water supply wells.

Additional details of these supplemental investigation activities are provided in Section 2 of this report.

2 Summary of Supplemental Site Investigation Activities

2.1 Well Installation Activities

To provide vertical delineation of the groundwater plume, AECOM installed three Type III monitoring wells (48DW-6, 48DW-7, and 48DW-8) in March 2012. A dual phase extraction well (48SVE-01) and three multi-level soil vapor monitoring points (VW-1, VW-2, and VW-3) were also installed for a proposed SVE pilot test (SVE pilot testing was completed to evaluate the potential for SVE technology to treat source area impact areas at the Site). These wells and monitoring points were installed using a combination of hollow stem auger and air rotary techniques. Well construction permits for monitoring wells (Permit Nos. WM0500868 and WM0500756) and SVE-01 (WR0500124) were obtained from the NCDENR prior to construction. Well and monitoring point locations are presented on Figure 1.2.

Monitoring well 48DW-6 was installed upgradient of the former NCDOT asphalt testing laboratory near 48MW-10 to a total depth of approximately 140 feet bgs. Monitoring well 48DW-7 was installed upgradient of the former NCDOT asphalt testing laboratory to a total depth of approximately 70 ft bgs. Monitoring well 48DW-8 was installed downgradient and to the east of the unnamed tributary to the Haw River to a total depth of approximately 120 ft bgs. Finally, 48SVE-01 was installed immediately adjacent to the former NCDOT asphalt testing laboratory to a total depth of 45 ft bgs. A summary of the well construction details is provided in Table 2.1 and the well construction records are included in Appendix A. The horizontal location and vertical elevation of each monitoring well was surveyed by Taylor Wiseman Taylor, a North Carolina licensed surveyor.

The Type III monitoring wells (48DW-6, 48DW-7, and 48DW-8) were constructed with six-inch outer casing advanced approximately three feet into the top of bedrock. The casing was grouted in place and allowed to set for approximately 24 hours. After the grout cured, the borehole was advanced using air rotary techniques to the total depths listed above. Wells 48DW-6 and 48DW-7 were constructed with two-inch diameter schedule 40 polyvinyl chloride (PVC) casing with 20 and 10 feet of 0.010-inch slotted PVC screen, respectively. A sand pack was placed in the annulus to a height of approximately two feet above the top of well screen. A bentonite seal was placed approximately two feet above the sand pack and hydrated. The remainder of the well annulus was filled with grout to the ground surface. Monitoring well 48DW-8 was left open hole below the outer-casing to facilitate multi-level groundwater sampling and borehole geophysical analysis.

The dual phase extraction well was constructed with six-inch diameter schedule 40 PVC casing with 45 feet of 0.010-inch slotted PVC screen. A sand pack was placed in the annulus to a height of approximately two feet above the top of the well screen. A bentonite seal was placed approximately two feet above the sand pack and hydrated. The remainder of the well annulus was filled with grout to the ground surface. The soil vapor monitoring points (VW-1, VW-2, and VW-3) are located five, ten and fifteen feet away from 48SVE-01, respectively. Each of these points consists of three vapor monitoring wells constructed of $\frac{3}{4}$ -inch PVC casing and screen. The three vapor monitoring wells at each point were installed with screen intervals from 4-5 feet bgs, 14-15 feet bgs, and 29-30 feet bgs to allow for vapor monitoring at various intervals during pilot testing.

Each well was secured with a locking expansion plug, and completed with a three-foot steel protective stick-up cover surrounded by a two-foot square concrete pad. After installation, each groundwater monitoring well was developed by pumping and surging with a submersible pump until the turbidity decreased. Development water was containerized in five gallon buckets and transferred to the on-site groundwater treatment facility for disposal. Drill cuttings were placed in 55-gallon drums and staged on-site pending disposal at a permitted facility by A&D Environmental, Inc., a NCDOT approved waste disposal operator.

A deep bedrock well (48PW-3) was installed by S.T. Wooten to be used as an industrial water supply well for dust suppression or a proposed concrete production facility. This well is located upgradient of the former NCDOT asphalt testing laboratory near the eastern property boundary. This Type III well was installed with steel casing to a depth of approximately 44 feet bgs and the borehole was left open to a total depth of approximately 305 feet bgs. However, at the time of the borehole geophysics survey described below, the total depth was measured at approximately 295 feet bgs.

2.2 Borehole Geophysics

To provide better understanding of water bearing zones and subsurface conditions, Mid-Atlantic Geosciences (MAG) was contracted to perform borehole geophysics on 48DW-8 and the water supply well recently installed by S.T. Wooten (SW-03 in geophysics report and 48PW-3 in AECOM reports). The geophysical logging included several sondes. These included:

- **Acoustic Televiwer:** a high-resolution acoustic televiwer (HRAT) was used to produce an image of the interior of each borehole created by reflected ultrasound. By recording both amplitude and travel time of each ultrasonic pulse, HRAT is able to produce two logs of the well. The amplitude log produces a log similar to a visual scan while the travel time log provides an indication of borehole diameter.
- **Caliper:** a spring-loaded, three arm caliper is used to measure borehole diameter as the probe is lifted upwards through the borehole. These measurements provide an indication of where solution openings or fractures are located.
- **Fluid Temperature:** Fluid temperature logs provide the temperature of the air or fluid in a borehole as a function of depth. Temperature logs can indicate where water is entering or leaving a borehole and can be used to locate zones of water movement within the borehole.
- **Fluid Conductivity:** Fluid conductivity provides a continuous measurement of the electrical conductivity of the borehole fluid. Fluid conductivity logs often deflect where water-producing features are transmitting water into or out of the well.
- **Natural Gamma:** The natural gamma log is used primarily to identify changes in lithology. Specifically, natural gamma logs indicate the relative amounts of clay in various sedimentary rock units.
- **Short and Long Normal Resistivity:** the resistivity sonde is equipped with a series of electrodes set at some fixed distance from each other. To take a measurement, a current is driven between the top of the sonde and the exposed cable 30 feet above the sonde. The potential difference, or voltage, between the short and long normal-spaced electrodes is recorded, and the resistance to current flow can be calculated. This resistance is converted to apparent resistivity, which is a physical property of the formation. In general, clay minerals or conductive (electrolytically) pore fluids are indicated by low resistivity while clean sand or carbonate beds with low porosity or low fluid conductivity within the porosity exhibit high resistivity.
- **Single Point Resistance (SPR):** SPR logs measure the resistance between an electrode on the sonde, and one buried at the ground surface near the wellhead. This provides a resistance that is specific to the particular geometry of the circuit (i.e. the placement of the wellhead electrode), and not a resistivity that is a physical property of the formation. However, the log provides relative data within a well that is sensitive to the presence of conductive minerals (e.g. clay) in the formation, and the degree of porosity and conductivity of the fluid in the porosity.
- **Spontaneous Potential (SP):** SP logging uses a lead electrode on a sonde to measure the naturally-occurring potential difference between the sonde in the formation and a reference electrode buried near the wellhead. Unlike resistivity and SPR logs, which are sensitive to beds, SP logs are sensitive to contacts between beds (or contacts between waters with differing ionic content).
- **Heat Pulse Flowmeter (HPFM):** the HPFM sonde consists of capacitors and thermistors. The capacitors discharge rapidly creating a thin disc of heated water. The heated disc of water disperses via conduction. Despite the heated water naturally rising due to convection, vertical flow in the well will move the heated disc up or down in the well. Two thermistors, mounted equidistant above and below the capacitors measure temperature differentials. The temperature differential can then be used to calculate a vertical flow rate in feet per minute (fpm) based on the known positions of the thermistors. If the borehole diameter is known, the flow in fpm can be converted to gallons per minute (gpm). In most cases, the HPFM sonde is used under static conditions. However, in some cases, HPFM can be used under stressed or pumping conditions, which induce artificial head differences.

MAG's Final Report for the borehole geophysics program conducted at the Site is provided in Appendix B. A brief summary of the findings for each well is provided below.

2.2.1 Well 48DW-8 Borehole Geophysics Results

- The total depth of the well was approximately 117.3 feet bgs;
- The caliper log revealed no significant enlargements in the borehole;
- The fluid temperature log indicated a deviation at 21.7 feet bgs (transition from casing to open borehole) and an offset at the top of the water column;

- The fluid conductivity log showed no significant deviations, offsets, or changes in slope except at the top of the water column;
- Televiewer logs indicated the largest aperture feature is a fracture zone located at 45.7 feet bgs. However, due to significant vertical deviation in the borehole, televiewer instrument centralization was affected causing image quality to be variable;
- The high electrical and low natural gamma logs showed generally smooth variations, likely due to the low clay content of the formation;
- Seven depths were chosen for HPFM measurements. Of these, measurable upward flow was detected at 45 and 47 feet bgs, with the largest flow being 0.317 fpm at 45 feet bgs.

2.2.2 Well 48PW-3 (SW-3 in Mid-Atlantic Geosciences Report) Borehole Geophysics Results

- The total depth of the well was approximately 295.3 feet below top of casing (TOC);
- The depth to water was measured at 26.7 feet below TOC at the time of the survey;
- The bottom of the casing was located at approximately 43.9 feet below TOC;
- The caliper log revealed numerous significant enlargements;
- The fluid temperature log showed no significant deviations, offsets, or changes in slope except at the top of the water column;
- The fluid conductivity log showed offsets at 73.5 feet and 99.1 feet below TOC and at the top of the water column;
- The largest aperture feature was a fracture zone located at 294.7 feet below TOC;
- The high electrical and low natural gamma logs showed generally smooth variations, likely due to the low clay content of the formation;
- Thirteen depths were chosen for HPFM measurements. Under static conditions, measurable upward flow was detected at 291 feet below TOC with a flow of 0.75 fpm. Based on these results, HPFM measurements were also collected under dynamic (pumping) conditions. Under dynamic conditions, measurable upward flow was detected at 224, 240, 250, 264, and 291 feet below TOC, with the largest flow being 0.716 fpm at 291 feet below TOC.

2.2.3 Soil Vapor Extraction/Dual Phase Extraction Pilot Test

SVE and DPE are source reduction technologies that are capable of removing volatile contaminants from the subsurface. During both SVE and DPE, air is extracted from the vadose zone soil, which transfers contaminants sorbed on soil into the gas phase. Extracted vapors are then either treated using a vapor phase treatment process, or directly discharged to the atmosphere. Since SVE is limited to vadose zone soils, the volatilization of target contaminants is often increased by the implementation of DPE. Using DPE, groundwater and vapors are simultaneously withdrawn from the treatment area, which lowers the groundwater table/increases the vadose zone thickness. Therefore, saturated soils containing sorbed contaminants are exposed to air flow and are removed (USEPA, 1997).

In March 2012, AECOM installed one SVE/DPE pilot test well and three multi-level (30, 15 and 5 feet bgs) vapor monitoring points for pilot testing SVE/DPE technology. On March 27, 2012, AECOM conducted an 8-hour vapor extraction pilot test to evaluate the effectiveness of SVE/DPE technology to remediate source area soils. Vacuum was provided using a vacuum truck with applied pressures ranging from 10.2 feet of water feet of water to 22.7 feet of water. During the test, vacuum and air flow readings from the three multi-level vapor monitoring points and the vapor extraction well were measured periodically using portable magnahelic vacuum gauges and flow meters, respectively. Results of the field pilot test indicated an effective SVE/DPE radius of influence of 8 to 10 feet. The limited radius of influence determined by the pilot test confirmed that vapor extraction is not likely to be an efficient remedial technology at the Site because the subsurface material (i.e., silt and/or clay) has low permeability to air. As a result, alternative remedial technologies are being evaluated.

3 Monitoring Methods

3.1 Groundwater Monitoring

The semi-annual groundwater monitoring event was performed in April 2012. Additional groundwater samples were also collected in May 2012. Twenty-five groundwater samples (including RW-1, RW-2 and 48PW-2), one trip blank, one duplicate, and two equipment blanks were collected in April 2012. Four additional groundwater samples were collected in May to confirm the results of the April samples from newly installed wells 48DW-8 and 48SVE-01 and an additional sample was collected from 48SVE-01 in June. Two privately owned wells (Mitchell and Sanders Wells) were also sampled. The on-Site field team consisted of two AECOM employees who collected and shipped the samples to SGS North America, Inc. (SGS) in Wilmington, North Carolina. SGS, a NCDOT contract laboratory, is certified by the State of North Carolina to perform the requested analyses. Sample locations are depicted on Figure 1.2.

3.1.1 Sampling Methods

Water level measurements, groundwater sampling, sample preservation and shipping were conducted in general accordance with the EPA Region IV guidance documents.

3.1.1.1 Monitoring and Recovery Well Sampling

Groundwater samples were collected from each of the groundwater monitoring wells and recovery wells (RW-1 and RW-2) in April 2012 during the regularly scheduled semi-annual groundwater sampling event. Confirmatory samples were collected from 48DW-8 and 48SVE-01 during May 2012. A third sample was collected from 48SVE-01 in June 2012.

Each monitoring well was purged with a peristaltic pump, submersible bladder or Grundfos® pump prior to sampling. Water levels were monitored at approximate three to five minute intervals and a steady flow rate was maintained. Field parameters (temperature, pH, specific conductance, dissolved oxygen [DO], and oxygen reduction potential [ORP]) were measured to ensure collection of a sample representative of formation water. Each well was considered ready for sampling when the parameters had stabilized to within 10 percent for three consecutive readings or if the well purged dry. After purging, groundwater samples were collected directly into laboratory supplied containers at low flow sampling rates. Field parameters were recorded on field data sheets.

The recovery wells (RW-1 and RW-2) pump continuously and were sampled from the individual faucets on the system influent pipes.

On May 30, 2012, AECOM redeveloped 48DW-8 and returned to the Site on May 31, 2012 to resample 48DW-08 and SVE-01. Low-flow sampling techniques were used to collect two samples from each well. Well 48DW-8 was first sampled with the pump (Grundfos®) set at 90 feet bgs, and then the pump was raised to 40 feet bgs. Sampling intervals were chosen based on water production observed while drilling the well. Well 48SVE-01 was first sampled using low flow techniques. Following low flow sampling, the pump discharge rate was increased until one well volume was removed from the well. Once a well volume had been extracted, the discharge rate was again decreased to low flow rates and an additional sample was collected. The number of well volumes removed was limited to reduce the amount of investigation-derived waste generated.

Groundwater samples were containerized, preserved, and shipped to the analytical laboratory. Groundwater samples collected in April and May were submitted for analysis by EPA Method 8260B. The samples collected in June (system influent and 48SVE-01) were submitted for analysis of 1,4-dioxane by EPA Method 8270D. Sampling equipment was thoroughly decontaminated with phosphate-free soap and distilled water prior to fieldwork and between wells to prevent cross-contamination.

Purge water produced during the April sampling event was temporarily contained prior to being treated through the on-Site treatment system. Purge water produced from 48SVE-01 in May and June was containerized in drums prior to off-Site disposal.

3.2 Surface Water

A surface water sample was collected on April 12, 2012 at the 48SW-1 location on Figure 1.2. The grab sample was collected by submerging a new, capped glass jar into the stream. The jar was uncapped underwater with the mouth of the jar pointed downstream. The jar was closed underwater and its contents were transferred into laboratory supplied containers. During the sampling process, the sampler was careful to stand beside the stream while sampling to reduce the extent of disturbance to the stream bottom. The surface water sample was analyzed for VOCs by EPA Method 8260B.

3.3 Private Water Supply Well Sampling

One water supply well, 48PW-2, is located on-Site. A sample was collected directly from the faucet at the well-head of 48PW-2 in April 2012. The sample from 48PW-2 was analyzed for VOCs by EPA Method 8260B. On the day of sampling, 48PW-2 was in use for facility operations.

Two off-Site, private water supply wells were sampled during this reporting period. The wells are located at 681 Mt. Gilead Church Road (Mitchell Well) and 771 Mt. Gilead Church Road (Sanders Well) as indicated on Figure 1.2. The Mitchell well was sampled on April 30 and August 1, 2012. The April 30 sample was submitted for laboratory analysis of VOCs by EPA Method 8260B, and the August 1 sample was submitted for laboratory analysis of VOCs by EPA Method 8260B and 1,4-dioxane by EPA Method 8270D. The Sanders Well was sampled on July 27, 2012 and submitted for laboratory analysis of VOCs by EPA Methods 8260B and 1,4-dioxane by 8270D. The Mitchell and Sanders wells were sampled from outdoor faucets, which were allowed to run for approximately 10 minutes prior to sampling.

4 Results

The following sections discuss the field and laboratory results of the first 2012 semi-annual groundwater monitoring event. Laboratory analytical reports from SGS and field data associated with samples collected by AECOM personnel were reviewed and validated to ensure that specific data-quality objectives were met. Laboratory analytical reports are provided in Appendix C.

4.1 Groundwater Elevations

Groundwater elevation data was collected from the Site monitoring wells in April and July 2012 and is presented in Table 2.1. The July 2012 data was used to prepare the groundwater potentiometric surface elevation contour map of the surficial (Figure 4.1) and shallow bedrock aquifers (Figure 4.2). Groundwater in the surficial and bedrock aquifers flows east/southeast toward an unnamed tributary of the Haw River. The average horizontal hydraulic gradient in the surficial aquifer was approximately 0.063 feet/foot (ft/ft) while the shallow bedrock aquifer had an average horizontal hydraulic gradient of approximately 0.019 ft/ft. Vertical hydraulic gradients were also calculated with data from paired shallow and deep wells at the Site. A downward vertical gradient was measured at well pairs 48MW-16/48DW-5 (0.022 ft/ft), 48MW-10/48DW-6 (0.022 ft/ft), and 48MW-12/48DW-4 (0.012 ft/ft) while the vertical gradient measured at well pair 48MW-11R/48DW-2 was 0.001 ft/ft upward. The July 2012 groundwater flow direction is consistent with historical data.

4.2 Groundwater Analytical Results

Groundwater samples were collected from Site monitoring wells on April 11 and 12 as part of the regularly scheduled semi-annual groundwater sampling event. Additional samples were collected from 48DW-8 and 48SVE-01 on May 31, 2012 and from 48SVE-01 on June 21, 2012. The analytical results are summarized in Table 4.1 and historical results are presented in Table 4.2. Field parameters, including temperature, DO, pH, conductivity, and ORP were recorded during the sampling events and are presented in Table 4.3.

The following is a summary of the groundwater monitoring results:

- TCE was detected at concentrations above its 2L Standard of 3 µg/L in monitoring wells 48MW-1 (16.2 µg/L), 48MW-11R (4.52 µg/L), 48MW-16 (478 µg/L), 48DW-2 (15.7 µg/L), 48DW-4 (3.3 µg/L), 48DW-5 (413 µg/L), 48DW-8 (178 µg/L; 206 µg/L; and 125 µg/L), and 48SVE-01 (48,600 µg/L; 70,700 µg/L; and 41,300 µg/L) and groundwater extraction wells RW-1 (324 µg/L), and RW-2 (86.1 µg/L). TCE was also detected at concentrations below its 2L Standard in monitoring wells 48DW-6 (1.58 µg/L), and 48DW-7 (1.61 µg/L).
- The horizontal extent of the TCE plume exceeding the 2L Standard in the surficial aquifer is generally defined by the monitoring well network. Delineation in bedrock is achieved by the combined monitoring well and private water supply (Mitchell and Sanders) well network. Isoconcentration maps of TCE in the surficial and shallow bedrock aquifers are presented on Figures 4.3 and 4.4, respectively.
- 1,1,1-TCA was detected in groundwater collected from monitoring well 48SVE-01 in April (3,200 µg/L) and May (1,710 µg/L) at concentrations above its 2L Standard of 200 µg/L.
- 1,1-DCE, a daughter product of both TCE and 1,1,1-TCA, was detected in groundwater at concentrations above its 2L Standard of 7 µg/L in monitoring wells 48MW-16 (46.8 µg/L), 48DW-5 (39.4 µg/L), 48DW-8 (13.6 µg/L and 14.5 µg/L) and 48SVE-01 (1,860 µg/L) and groundwater extraction well RW-1 (15 µg/L). 1,1-DCE was also detected at concentrations below its 2L Standard in monitoring wells 48MW-1 (2.22 µg/L), 48MW-3 (2.51 µg/L), and 48DW-2 (5.82 µg/L) and in groundwater extraction well RW-2 (6.35 µg/L).
- cis-1,2-DCE, a TCE daughter product, was detected in groundwater at concentrations below its 2L Standard of 70 µg/L in monitoring wells 48MW-11R (1.89 µg/L), and 48DW-2 (4.98 µg/L).
- 1,1-DCA, a daughter product of 1,1,1-TCA, was detected in groundwater at concentrations below its 2L Standard of 6 µg/L in monitoring wells 48MW-3 (3.42 µg/L) and 48DW-2 (2.38 µg/L).

- Tetrachloroethene (PCE) was detected in groundwater collected from monitoring wells 48MW-1 (1.61 µg/L) and 48MW-3 (2.78 µg/L), and groundwater extraction well RW-1 (10.4 µg/L), at concentrations above its 2L Standard of 0.7 µg/L. According to the NCDOT, PCE was not used by their asphalt testing laboratory. PCE degradation products can include TCE, cis-1,2-DCE; and vinyl chloride.
- Ethylbenzene, toluene, and o-Xylene were detected in groundwater collected from Site monitoring wells at concentrations below 2L Standards. These compounds are commonly associated with petroleum products and are not a target NCDOT constituent.
- On June 21, 2012, 48SVE-01 and the system effluent were sampled for 1,4-dioxane. 1,4-dioxane was detected in groundwater collected from monitoring well 48SVE-01 (92.5 µg/L), but 1,4-dioxane was not detected in the system effluent sample (<2.16 µg/L).

4.3 Surface Water Analytical Results

VOCs were not detected in the surface water sample (48SW-1) collected on April 12, 2012. Historical surface water analytical results are summarized on Table 4.4.

Surface water sampling at 48SW-1 began in January 2002 and the GWTS has operated with intermittent downtime since September 11, 2003. The GWTS was shut down due to equipment failure between August 2005 and February 2006 and between July 1, 2006 and January 19, 2007 to allow for an upgrade from single to three-phase electrical service.

Prior to GWTS startup, TCE was detected in samples collected at 48SW-1 during three of four sampling events at concentrations above the Title 15A NCAC, Subchapter 2B, Section 0.216 (2B Standard [2.5 µg/L]). After GWTS startup, TCE was not detected in surface water until September 2005 (16 µg/L) when the system was shut down due to equipment failure. TCE was not detected in the sample collected during April 2006, shortly after the system was restarted in February 2006. TCE was detected above the 2B Standard in the surface water sample collected at 48SW-1 during October 2006 (16 µg/L), which was collected while the system was down for an electrical service upgrade. Since January 2007, the GWTS has been operating with minimal disruption and TCE has not been detected above the 2B Standard in any sampling event.

Based on a review of the historical surface water analytical data, the GWTS is effectively controlling migration of the plume to surface water.

4.4 Private Water Supply Well Sampling Results

VOCs and 1,4-dioxane were not detected above laboratory detection limits in the private water supply well samples (Mitchell Well and Sanders Well) collected on April 30, July 27, and August 1, 2012. Laboratory analytical results are summarized on Table 4.5.

5 Remediation System Performance

This section addresses remediation system performance during the period from January 1, 2012 through June 30, 2012.

5.1 Air Sparge and Soil Vapor Extraction Systems

The AS and SVE systems were installed in 2002 to remediate contamination in the shallow aquifer. The systems operated with temporary interruptions from October 8, 2002 to August 12, 2010.

The results of the 2010 soil and groundwater investigation indicated the area of highest soil impacts is located near the former asphalt testing laboratory and outside the AS/SVE system treatment zone (Figure 5.1). In addition, the groundwater pump and treat system has effectively lowered the water table of the surficial aquifer below the screened interval of the air sparging wells (Figure 5.2). Consequently, the AS and SVE treatment systems were shut down on August 12, 2010.

5.2 Groundwater Treatment System

The groundwater treatment system is designed to control the migration of contaminants by extracting groundwater from the two recovery wells (Figure 1.2). Groundwater is pumped to the equalization tank and through an air stripper and carbon filtration to remove VOCs and then discharged into an unnamed tributary of the Haw River in accordance with NPDES permit NC0087629. The system is permitted to discharge up to 10-gallons per minute (gpm).

5.2.1 Groundwater Extraction Rates

During the reporting period (January 1, 2012 through June 30, 2012), a total of 353,838 gallons (1.34 gpm) of water were treated by the groundwater treatment system. Of this total, 98 percent was from recovery well RW-1.

5.2.2 Hydraulic Capture

Figure 4.1 is a shallow groundwater potentiometric surface map based on groundwater elevation data collected from monitoring wells in July 2012. Based on elevation contours, the extraction well network captures groundwater within the vicinity of the existing VOC plume.

5.2.3 Volatile Organic Compound Mass Recovery

Figure 5.3 presents the calculated total VOC mass recovery for the system since startup in 2003. Based on the system flow rates and influent VOC concentrations, an average of 0.003 pounds per day of VOCs were removed during the first half of 2012. As of June 28, 2012, approximately 13 pounds of VOCs have been removed from groundwater since startup in 2003 (Figure 5.3).

5.2.4 Treatment Efficiency

Effluent sampling is conducted monthly in accordance with the requirements of the NPDES permit. The effluent sample collected on April 10, 2012 had a detection of TCE (6.28 µg/L) above the permit Monthly Average (4.1 µg/L) and Daily Maximum (6.15 µg/L) limits. All other parameters were below their respective limits during the reporting period.

Based on the April 10, 2012 analytical results, the effluent was re-sampled and the groundwater treatment system was turned off on April 30, 2012. Analytical results of the effluent sample collected on April 30, 2012 indicated detections of TCE (4.17 µg/L) at concentrations above the Monthly Average limit, but below the Daily Maximum limit. Based on these results, the Operator in Responsible Charge replaced the carbon polishing filters and restarted the system on May 18, 2012. The system has operated within compliance since May 18, 2012. VOCs have not been detected in system samples since the sample collected on April 30, 2012.

5.2.5 Operation and Maintenance

During weekly monitoring events, the Operator in Responsible Charge, Mr. Jeff Leaver or backup Operator in Responsible Charge, Mr. Aaron Hill, of Environmental Field Management recorded the system flow rate (gpm), total flow (gallons) and resettable flow (gallons).

6 Summary and Recommendations

Based on analytical data obtained during the April/May 2012 monitoring event and groundwater treatment system evaluation from January 1 through June 30, 2012, the performance of the groundwater treatment system at the NCDOT Pittsboro Asphalt Testing Site Number 6-48 can be summarized as follows:

- The groundwater VOC plume concentrations continue to be stable. The groundwater plume in the surficial aquifer is generally defined by the existing monitoring well network, and based on surficial and shallow elevation contours; the extraction well network captures groundwater within the vicinity of the VOC plume. Delineation in bedrock is achieved by the combined monitoring and private water supply (Mitchell and Sanders) well network.
- NCDOT has been granted property owner permission to continue semi-annual sampling of the water supply wells located at 681 Mt. Gilead Church Road (Mitchell Well) and 771 Mt. Gilead Church Road (Sanders Well). Sampling results will be included in future groundwater monitoring reports.
- NCDOT will continue semi-annual groundwater monitoring and the next event is scheduled for October 2012. Sample location SVE-01 will be added to the sampling plan during future events.
- Results of the SVE/DPE pilot test indicated that this technology will be inefficient for treating source area impacts near the former asphalt testing laboratory. As a result, alternative remedial technologies are being evaluated.
- To provide better delineation of the groundwater plume, NCDOT proposes to install four additional groundwater monitoring wells at the Site. One Type II and three Type III wells are proposed at the locations illustrated on Figure 6.1. The exact location and design of the proposed wells will be determined based on field conditions.
- Based on the results of the 2012 borehole geophysical analysis, NCDOT proposes to conduct packer testing on 48PW-3. Multiple intervals will be evaluated allowing further analysis of groundwater conditions at various depths. S.T. Wooten will reportedly use the new extraction well for dust suppression or a proposed concrete production facility (Butch Lawter, personal communication). When operational, the well should be sampled periodically to evaluate the affects of pumping on the groundwater plume.
- To better evaluate surface water impacts, NCDOT proposes to monitor two additional sampling locations during future monitoring events. One location is proposed approximately 100-feet upstream of existing location 48SW-1. The other location will be located approximately 100-feet downstream of 48SW-1 and north of Sugar Lake Road. Proposed sampling locations are illustrated on Figure 6.1.
- To evaluate if and where the groundwater plume discharges to surface water, NCDOT proposes pore water sampling along the stream downgradient of the plume. Pore water samples will be collected with a manual push point sampler at intervals of approximately 100 feet depending on access and sediment conditions. Proposed pore water sample locations are illustrated on Figure 6.1. The exact location and intervals for field screening may be adjusted based on field conditions.
- The GWTS has been operational since September 11, 2003. Since operation began the system has removed an estimated 13 pounds of VOCs.
- Based on a review of the historical surface water analytical data, the GWTS is effectively controlling migration of the plume to surface water. When the GWTS is operational there have been no exceedances of VOC 2B Standards in surface water samples collected.

2B Standard		NS	6	330	2.5	60

Notes

1,1,1-TCA = 1,1,1-trichloroethane

1,1-DCA = 1,1-dichloroethane

1,1-DCE = 1,1-dichloroethene

TCE = trichloroethylene

cis-1,2-DCE = cis-1,2-dichloroethene

< - constituent was not detected above the quantitation limit

Results are in micrograms per liter ($\mu\text{g/L}$)

2B Standard - Title 15A North Carolina Administrative Code (NCAC) Subchapter

2B Surface Water Quality Standards (August 2012)

Red Book standards are in red font.

No other EPA Method 8260B Target Compound List Volatile Organic Compounds were detected.

Table 4.5
Summary of Private Water Supply Well Analytical Results
NCDOT - Former Asphalt Plant Site
Pittsboro, North Carolina

NCDOT Target Compounds	2L Standard	Mitchell Well		Sanders Well
		4/30/12	8/1/12	7/27/12
PCE	0.7	<1	<1	<1
TCE	3	<1	<1	<1
cis-1,2-DCE	70	<1	<1	<1
1,1,1-TCA	200	<1	<1	<1
1,1-DCA	6	<1	<1	<1
1,1-DCE	7	<1	<1	<1
non-Target Compounds				
1,4-Dioxane	3	na	<2.02	<2.03
Ethylbenzene	600	<1	<1	<1
Toluene	600	<1	<1	<1
o-Xylene	500	<1	<1	<1

Notes:

All samples were analyzed for volatile organic compounds by EPA Method 8260E

1,4-dioxane analyzed by EPA Method 8270C

2L Standard - Title 15A North Carolina Administrative Code (NCAC) Subchapter 2L
Groundwater Quality Standards (January 2010)

< - constituent was not detected above the quantitation limit

All results are reported in micrograms per liter ($\mu\text{g/L}$)

Constituents detected above NCAC 2L Groundwater Standard are shaded

Constituents detected above the laboratory detection limit are **bold**

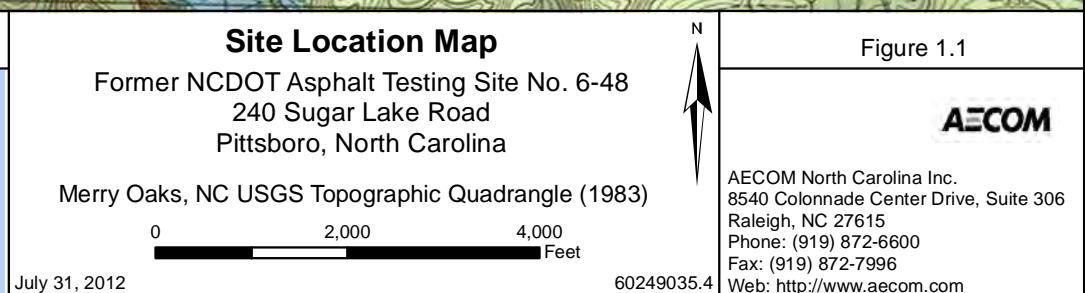

na - not analyzed

VOCs and 1,4-dioxane were not detected above laboratory detection limits

Detection limits reported for compounds recently detected in on site wells

PCE	Tetrachloroethene
TCE	Trichloroethene
1,1,1-TCA	1,1,1-Trichloroethane
1,1-DCE	1,1-Dichloroethene
1,1-DCA	1,1-Dichloroethane
cis-1,2-DCE	cis-1,2-Dichloroethene

RE: Borehole Geophysical Logging Program
Two Wells – 48DW-8 and SW-03
240 Sugarlake Road
Pittsboro, NC
MAG Reference Number 051202

Dear Mr. Brennan:

Pursuant to our proposal dated May 2, 2012, Mid-Atlantic Geosciences (MAG – the borehole logging division of Enviroscan, Inc.) completed the above-referenced survey on June 20 and 21, 2012. The objective of the survey was to locate and characterize fractures and potential water-bearing zones intersecting the wells. To accomplish these objectives, MAG conducted Acoustic TelevIEWer, 3-Arm Caliper, Fluid Temperature, Fluid Conductivity, Natural Gamma, Short- and Long-Normal Resistivity, Single Point Resistance, Spontaneous Potential, and Heat Pulse Flowmeter logging in the wells.

Logging Equipment

Mid-Atlantic Geosciences conducts borehole geophysics, televIEWer, and video logging using a Robertson Geologging, Ltd. Micrologger II and/or a Mount Sopris Matrix. These units record digital data for on-site log playback, reproduction, and field interpretation, as well as post-processing and report presentation. The systems are driven by field PCs running software supplied by the manufacturer for data acquisition, log replay, probe control, probe calibration, and logging environment compensation. Video data (if collected) are recorded in real time to the hard drive of a DVD player/recorder, and can be burned in the field to a DVD that is left with the client's on-site representative.

All of the logging instruments are permanently mounted in a dedicated Ford F350 or Dodge RAM2500 enclosed-bed truck, each with a self-contained power supply, and support and decontamination equipment. The downhole probes or sondes are connected to either a Robertson Geologging Smartwinch with approximately 600 feet of 0.375-inch coaxial cable, or a Robertson 2000m winch with approximately 3000 feet of 0.25-inch coaxial cable – depending on the depth of the wells logged.

Mr. Brennan
July 31, 2012
Page 2

Logging Parameters and Methodology

Geophysical well logging in general involves lowering sondes in a borehole and recording parameters that are related to the properties of the adjacent soil or rock, the fluids in the borehole or formation, and/or construction details of the well. There are many tools and techniques that have been developed to provide specific information in different environments and constructions of drilled holes. The data collected can define the nature and extent of geologic formations and formation fluids, and can be used to provide correlation between holes.

The sondes used for this survey are described below. Note that before any of these tools are put into service for a particular job, MAG personnel test them for proper function and recalibrate as necessary. This is essential to the proper acquisition of downhole data and the ability to relate the data from one borehole to another.

Acoustic Televiwer

The high-resolution acoustic televiwer (HRAT) provides a scan or image of the interior of the borehole that is created not by reflected visible wavelength light, but by reflected ultrasound. Since ultrasonic pulses are used, it is possible to record both the amplitude and travel time of each pulse, and construct two separate images. The amplitude log is analogous to a visual scan, while the travel time data are affected primarily by the local diameter of the borehole (i.e. the larger the bore, the later the arrival of the reflected pulse), and therefore can supplement or replace a caliper log. The main advantage of the HRAT probe is that it can be used in larger boreholes than optical tools, and in holes with turbid or particle-loaded fluids that would be opaque to optical methods.

The HRAT operates by using a fixed acoustic transducer and a rotating acoustic mirror capable of focusing on the borehole wall at any distance from the probe diameter upwards. The acoustic transducer is focused based on the borehole diameter and impedance-matched to the borehole fluid to provide optimum image resolution and reflected amplitude. Mirror rotation speed (i.e. circumferential resolution), sampling rate (i.e. depth resolution), signal gain (i.e. amplitude image contrast), and recording time gate (i.e. travel time image contrast) are all variable and under operator control to provide the best image possible under borehole-specific conditions.

Mr. Brennan
July 31, 2012
Page 3

HRAT logs are presented as accurately-scaled and accurately-oriented cylindrical images that are sliced open and laid flat. Therefore, planar dipping features appear as sinusoids from which the strike and dip of the feature can be calculated (see Appendix A). Selected and representative televiewer features are listed in Appendix B and on the log sheet. Based on their visual character, planar features have been categorized as various types of geologic interface (fractures, bedding planes, veins, etc.). Feature apertures are listed in tenths of an inch. An aperture of zero for an open fracture simply means that while it appears to be a continuous open feature, the opening is smaller than the line thickness on the log (~0.015 inches). Note that it has been the experience of MAG that the aperture or Paillet rank of a feature is not always a strong indicator of its water-producing potential. Thin, discrete features sometimes produce as much or more water (as evidence by flow meter logging or packer testing) than wide, open fractures or fracture zones.

Caliper

Caliper measurements represent the average diameter of the borehole or well at a given depth. The caliper tool collects and transmits the data from three spring-loaded arms as the tool is lifted upwards through the borehole. The caliper tool is used to locate solution openings or fractures (where the borehole is typically enlarged due either to the presence of natural openings, or to plucking of broken rock by the drill bit), and to determine the length of casing intervals (as evident from small changes in casing diameter, or the small enlargements at threaded junctions, or narrowing due to the bead at welded junctions).

Caliper logs are collected by calibrating the downhole tool with a measuring template, lowering the tool to the base of the well, remotely opening the arms, and then logging the open borehole and casing diameter in an upward direction. Caliper logs are acquired with a logging speed of no more than 12 feet per minute.

Fluid Temperature

Fluid temperature logs provide the temperature of the air or fluid in a borehole as a function of depth. Temperature logs can indicate where water is entering or leaving a borehole – and thereby disturbing the normal geothermal gradient. Deviations, offsets, or changes in the slope of the temperature log can be used to locate zones of water movement within the borehole. Temperature logs must be run in wells that have been allowed to fully equilibrate to the local geothermal gradient following any prior drilling, construction, pumping or sampling. During a temperature survey, data accuracy is ensured by maintaining a downward logging speed of approximately 10 feet per minute (fpm). This provides an adequate time buffer to allow sensors to respond to minor temperature changes.

Mr. Brennan
July 31, 2012
Page 4

Fluid Conductivity

Fluid conductivity logs provide a continuous measurement of the electrical conductivity of the borehole fluid – i.e. zero in air or hydrocarbons, greater than zero in water. In water, electrical conductivity is mostly a function of electrolytic content. Water with very low dissolved solid concentrations will yield low fluid conductivity, while water containing a high level of dissolved solids will be proportionally more conductive. Fluid conductivity logs often deflect where water-producing features are transmitting water into or out of the well (since the well water may have a differing electrolytic chemistry than the formation water). The fluid conductivity log is usually collected simultaneously with the temperature log – since for both, data from a fully equilibrated water column is required.

Natural Gamma

Gamma logs are one of the most widely used geophysical logs in groundwater applications. They are used primarily to identify changes in lithology – specifically the relative amounts of clay in various sedimentary units.

A gamma log provides a record of the total natural gamma radiation detected within a given energy range. In water-bearing rocks and sediments that are not contaminated by artificial radioisotopes, the most significant naturally-occurring, gamma-emitting radioisotopes are potassium-40 and the daughter products of the uranium and thorium decay series. If gamma-emitting artificial radioisotopes have been introduced by humans into the groundwater system, they will also produce part of the radiation measured.

The amplitude of gamma-log deflections is affected by any borehole condition that alters the density of the material through which gamma photons must pass or the length of the travel path. The bedding of a gamma-emitting formation must be thick to obtain a quantitative value since the detector will be affected by the radiation from the formation as the tool approaches and passes the bed. Although increases in borehole diameter or the presence of steel casing will decrease the recorded gamma count, it is possible to collect usable information in both cased and open portions of the borehole using the gamma sonde. The presence of potassium-rich (and therefore gamma-emitting) bentonite clay commonly used in well construction will generally produce high gamma count peaks on a natural gamma log. MAG has natural gamma detectors on many sondes, and comparison of the multiple gamma logs collected for any given well logging program are used to ensure that the depths of differing logs are not erroneously shifted. Therefore, the gamma log presented for any well may have been collected simultaneously with any of the other logs from the same well.

Mr. Brennan
July 31, 2012
Page 5

Short and Long Normal Resistivity

In resistivity logging, the sonde is set up with a series of electrodes set some fixed distance away from each other. The most common arrangement of these spacings is 16 inches (short normal) and 64 inches (long normal) apart. To take a measurement, a current with a fixed low amperage (I , typically tens of millamps) is driven between the tip of the sonde, and the exposed cable armor 30 feet above the sonde. The potential difference or voltage (V) between the short and long normal-spaced electrodes is recorded, and the resistance to current flow (R) in the formation is then given by Ohms law ($R=V/I$). This resistance (in Ohms), which is a property of the electrical circuit created by the electrodes and formation, is converted to apparent resistivity (in Ohm-meters), which is a physical property of the formation, based on the known electrode geometry. Readings are recorded continuously as the sonde is lowered in the borehole – typically at less than 20 fpm.

In most situations, the 16-inch or short normal log is used to interpret the electrical properties of the formation near the borehole, or in the invaded zone. The 64-inch or long normal log gives a better indication of the resistivity deeper in the formation where there may be no effect from the drilling itself. Care must be taken when interpreting resistivity logs since thin beds that measure close to the thickness of the electrode spacing on the sonde may cause a reverse response. Therefore, normal resistivity logs are most useful in boreholes with thick lithologic units. The presence of thin-bed reversals can also be detected by comparing the normal resistivity logs with the single point resistance (SPR) log described below (which they should generally mimic in the absence of reversals). Normal resistivity logs are typically collected along with SPR and spontaneous potential (SP) logs using a single sonde. The interpretation of resistivity logs is generally straightforward. Low resistivities represent clay minerals or conductive (e.g. electrolytic) pore fluids, while high resistivities represent clean sand or carbonate beds with low porosity or low fluid conductivity within the porosity. Normal resistivity logs record a physical property of the formation, and can therefore provide valuable comparisons between differing wells.

Single Point Resistance

Single point resistance (SPR) logs measure the resistance (in Ohms) between an electrode on the sonde, and one buried at the ground surface near the wellhead. This provides a resistance that is specific to the particular geometry of the circuit (i.e. the placement of the wellhead electrode), and not a resistivity that is a physical property of the formation. However, the log provides relative data within a well that is sensitive to the presence of conductive minerals (e.g. clays) in the formation, and the degree of porosity and conductivity of the fluid in the porosity. The interpretation of resistance logs is also straightforward, and follows the relative patterns described above for normal resistivity logs. However, SPR values are relative, and may be difficult to compare between different wells.

Mr. Brennan
July 31, 2012
Page 6

Spontaneous Potential

Spontaneous potential (SP) logging is the oldest and simplest method. It uses a lead (non-polarizing) electrode on a sonde to measure the naturally-occurring potential difference (typically in millivolts) between the sonde in the formation, and a reference electrode buried near the wellhead. Naturally-occurring potential differences are commonly present at the interfaces between materials with differing ionic content – e.g. at contacts between saturated sand and shale, or between salty and fresh water. Note that unlike resistivity and SPR logs that are sensitive to beds, SP logs are sensitive to the contacts between beds (or contacts between waters with differing ionic content). Like SPR, SP values are relative, and therefore difficult to compare between wells. SP logs are typically recorded along with normal resistivity and SPR logs at speeds of less than 20 fpm.

Heat Pulse Flowmeter

Unlike all other logs that are continuous records of some parameter versus depth, heat pulse flowmeter (HPFM) logs are made with the sonde stationary in the borehole at discrete depth intervals or at stations selected to suit a particular study. In the sonde, large capacitors are charged from the surface power supply and can be discharged rapidly on command through a high resistance wire grid (like the heating elements on an electric stove). The discharge creates an infinitesimally thin disc of heated water. By conduction alone, the heat in this disc disperses slowly due to the poor heat conduction of water. In addition, the slight change in density of the heated water will cause it to rise very slowly (i.e. by convection). However, in the presence of vertical flow, the heated disc of water will move up or down with the flow velocity. In the sonde, thermistors are set at fixed equal distances above and below the heating grid, and sense the passage of the heated disc. Prior to firing the heating element, the two thermistor outputs are equalized so it is possible to interpret any subsequent differential output as a relative change in temperatures between thermistors. The temperature differential data is sent to the surface where the flow rate (in fpm) can be calculated based on the known positions of the thermistors. If the borehole diameter is known, the flow in fpm can be converted to gallons per minute (gpm). Note that by convention, negative flow values represent downward flow.

The main limitation of the heat pulse flowmeter is that it can only accurately measure the vertical component of flow in a borehole. Any horizontal flow cannot be quantified due to the location of the thermistors relative to the heat grid. This factor must be taken into consideration when interpreting heat pulse flowmeter data. Unfortunately, there is no reliable tool for measuring horizontal flow in a borehole. In addition, please note that even in the presence of water-bearing features, vertical flow will only occur in a static well if it intersects two or more features with differing hydraulic heads. For example, a well might intersect just a single, highly productive zone, but since there is no other zone with a different head, the only static flow in the well would be horizontal (across the well - if at all). Therefore, lack of vertical flow under static conditions does not necessarily imply an absence of hydrogeologically important features.

Mr. Brennan
July 31, 2012
Page 7

The heat pulse flowmeter is typically operated after the borehole has stabilized from the effects of any prior logging runs in the borehole. In addition, after moving the sonde itself, the hole is allowed to equilibrate before taking any measurements. At each station, multiple measurements are usually recorded to ensure repeatability. The borehole is also allowed to equilibrate between successive measurements at a given station to ensure that the measured flow is due to natural flow conditions, and not conduction or convection from previous measurements. The heat pulse flowmeter is typically run under static conditions and may not quantify flow in some water-producing zones where there is only horizontal flow and/or no head difference between adjacent features. However, in some cases, these zones may be identified by recording heat pulse flowmeter data under stressed or pumping conditions which induce artificial head differences.

Logging Results

The wells were logged on June 20 and 21, 2012. The logging results for the wells are presented on the enclosed digital logs and tables, and briefly summarized below.

Note that since analysis of borehole geophysical logs can be quite subjective, and the level of detail is dependent upon the specific goals of the geologist, the analysis by MAG below covers the major features of each log, as well as some possibly minor features to serve as examples or guides for further interpretation by geologists familiar with the site, local geology, and/or project goals. In general, logs may display deviations (i.e. "spikes" where the parameter deviates from, and then returns to, "background" level), offsets (changes in background level), or slope changes. Any of these could be considered significant in certain situations, or when compared to correlating features at the same depth on other logs. If there are any questions about the features discussed (or not discussed) below, please do not hesitate to contact MAG.

Mr. Brennan
July 31, 2012
Page 8

48DW-8

Noted Features

- The total depth (TD) of the well was logged at approximately 117.3 feet below ground surface (BGS).
- The depth to water (DTW) was measured at 7.9 feet BGS at the time of the survey.
- The diameter of the casing at the surface was measured to be six inches, and the bottom of the casing (BOC) was located at approximately 21 feet BGS.
- The caliper (borehole diameter) log reveals no significant enlargements in the borehole.
- The fluid temperature log shows a deviation at 21.7 BGS and an offset at the top of the water column.
- The fluid conductivity log shows no significant deviations, offsets, or changes in slope except at the top of the water column.
- Few planar features were recognizable on the televiewer logs. The depth, strike, dip, aperture, and feature type are listed on the log, as well as on the accompanying table in Appendix B. The largest aperture feature is a fracture zone located at 45.7 feet BGS. Note that due to significant vertical deviation in this borehole, televiewer instrument centralization was affected; therefore, the image quality is variable.
- The high electrical and low natural gamma logs show generally smooth variations that are probably related primarily to the low clay content of the formation.

Mr. Brennan
July 31, 2012
Page 9

- Based primarily on the locations of caliper anomalies and televIEWer features recognized in the field, seven stations or depths were selected for heat pulse flowmeter measurements. The recorded flows (based on an averaging of three to seven individual measurements per station) are listed below, with positive being upward flow and negative being downward flow. Measurable upward flow was detected in the borehole at 45 and 47 feet BGS, with the largest flow being 0.317 FPM at 45 feet BGS.

SW-03

Noted Features

- The total depth (TD) of the well was logged at approximately 295.3 feet below the top of casing (TOC).
- The depth to water (DTW) was measured at 26.7 feet below TOC at the time of the survey.
- The diameter of the casing at the surface was measured to be six inches, and the bottom of the casing (BOC) was located at approximately 43.9 feet below TOC.
- The caliper (borehole diameter) log reveals numerous significant enlargements at 45.8, 58, 63.5, 65.7, 70.8, 75.6, 81.2, 84.2, 85.4, 87.5, 90, 98.3, 107.8, 139, 220.5, 228.5, 229.2, 230.2, 232.8, 238.2, and 294.7 feet below TOC.
- The fluid temperature log shows no significant deviations, offsets, or changes in slope except at the top of the water column.
- The fluid conductivity log shows offsets at 73.5 and 99.1 feet below TOC and the top of the water column.
- Numerous planar features were recognizable on the televiewer logs. The depth, strike, dip, aperture, and feature type are listed on the log, as well as on the accompanying table in Appendix B. The largest aperture feature is a fracture zone located at 294.7 feet below TOC.
- The high electrical and low natural gamma logs show generally smooth variations that are probably related primarily to the low clay content of the formation.

Mr. Brennan
 July 31, 2012
 Page 11

- Based primarily on the locations of caliper anomalies and televIEWer features recognized in the field, thirteen stations or depths were selected for heat pulse flowmeter measurements. The recorded flows (based on an averaging of three to seven individual measurements per station) are listed below, with positive being upward flow and negative being downward flow. Under static conditions, measurable upward flow was detected in the borehole at 291 feet below TOC with a flow of 0.75 FPM. Under dynamic conditions, measurable upward flow was detected in the borehole at 224, 240, 250, 264, and 291 feet below TOC, with the largest flow being 0.716 FPM at 291 feet below TOC.

Limitations

In making verbal or written interpretation of logs, MAG personnel give the client the benefit of their best professional judgment. However, since all interpretations are based on inference from electrical, magnetic, or other indirect measurements, MAG does not, and cannot, guarantee the accuracy or the correctness of any such interpretations. MAG shall not be liable for any loss, damages, or expenses resulting from reliance on such interpretations. MAG does not warrant the accuracy of log data transmitted by any electronic process and will not be responsible for intentional interpretation of log data by others. MAG makes no warranties – neither explicit nor implied. Under no circumstances shall MAG, its parent company Enviroscan, Inc., or their personnel be liable for consequential damages.

We appreciate this opportunity to have worked with you again. If you have any questions, please do not hesitate to contact me.

Sincerely,
Mid-Atlantic Geosciences

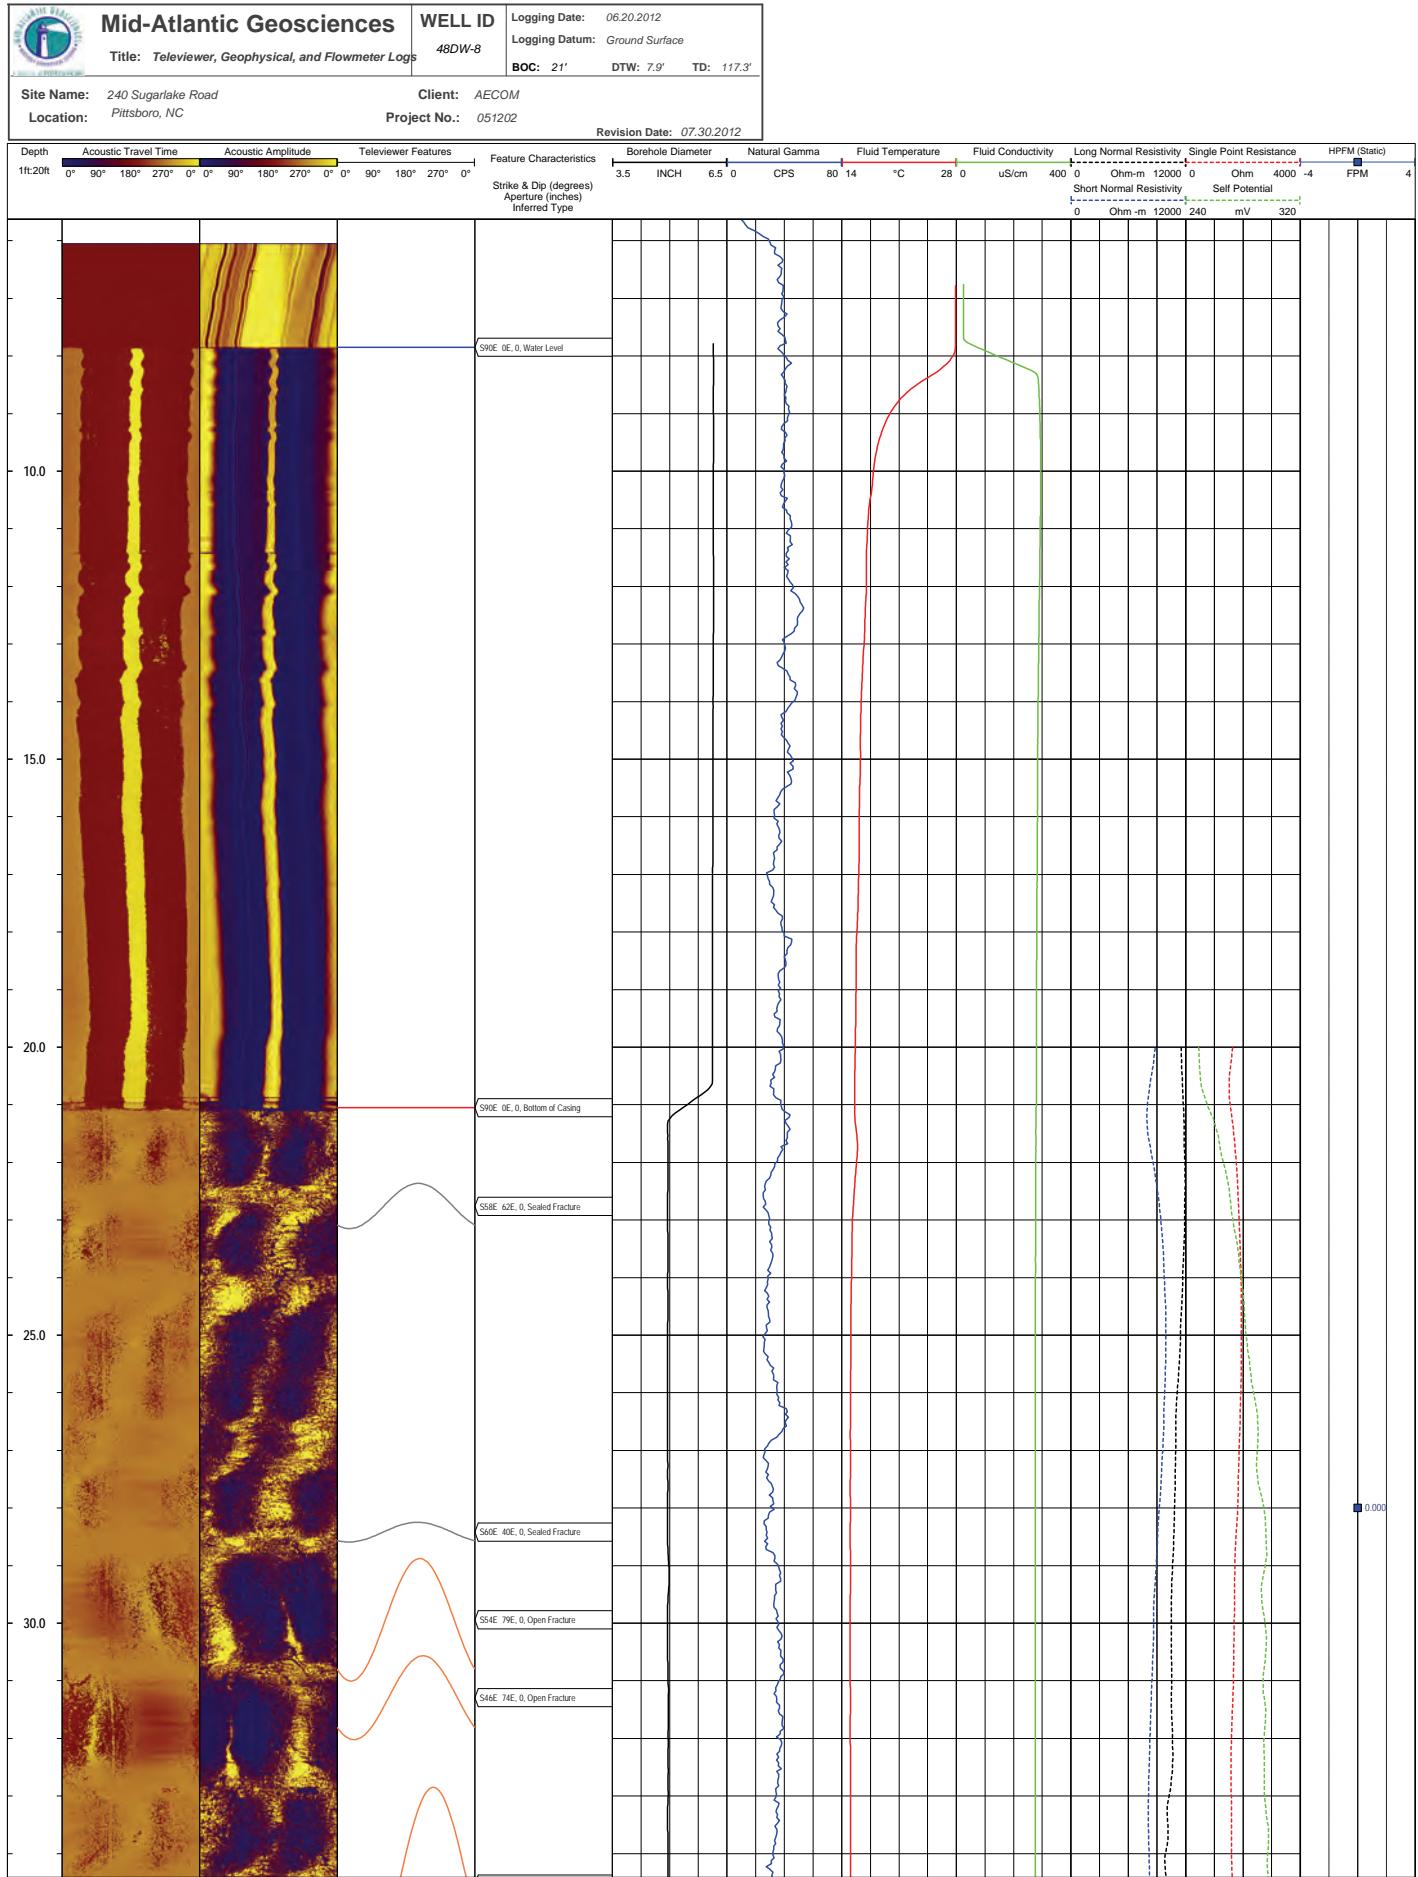

Duro Rajkovic
Project Geophysicist

Planar Feature Orientation Parameters

Planar Feature Orientation Parameters

Dip = angle of inclination of the plane, downwards from the horizontal
Dip azimuth = azimuth of the line of maximum dip in the plane, clockwise from North
Strike direction = azimuth of a horizontal line in the plane (= dip azimuth - 90°)

e.g. dip and dip azimuth = 60° N041° or strike and dip = N311° 60°

e.g. Stratigraphic dip
or 'bedding'

Other planar geologic features include
joints/fractures/veins
faults
cleavage/schistosity

Appendix C. Laboratory Analytical Reports

Laboratory Report of Analysis

To: Matt Brennan
8540 Colonnade Center Drive
Suite 306
Raleigh, NC 27615

Report Number: **31201318**

Client Project: **NCDOT Pittsboro**

Dear Matt Brennan,

Enclosed are the results of the analytical services performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. All results are intended to be used in their entirety and SGS is not responsible for use of less than the complete report. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Barbara A. Hager at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America Inc.

Barbara A. Hager
Project Manager
barbara.hager@sgs.com

Date

Laboratory Qualifiers

Report Definitions

DL	Method, Instrument, or Estimated Detection Limit per Analytical Method
CL	Control Limits for the recovery result of a parameter
LOQ	Reporting Limit
DF	Dilution Factor
RPD	Relative Percent Difference
LCS(D)	Laboratory Control Spike (Duplicate)
MS(D)	Matrix Spike (Duplicate)
MB	Method Blank

Qualifier Definitions

*	Recovery or RPD outside of control limits
B	Analyte was detected in the Lab Method Blank at a level above the LOQ
U	Undetected (Reported as ND or < DL)
V	Recovery is below quality control limit. The data has been validated based on a favorable signal-to-noise and detection limit
A	Amount detected is less than the Lower Method Calibration Limit
J	Estimated Concentration.
O	The recovery of this analyte in the OPR is above the Method QC Limits and the reported concentration in the sample may be biased high
E	Amount detected is greater than the Upper Calibration Limit
S	The amount of analyte present has saturated the detector. This situation results in an underestimation of the affected analyte(s)
Q	Indicates the presence of a quantitative interference. This situation may result in an underestimation of the affected analyte(s)
I	Indicates the presence of a qualitative interference that could cause a false positive or an overestimation of the affected analyte(s)
DPE	Indicates the presence of a peak in the polychlorinated diphenylether channel that could cause a false positive or an overestimation of the affected analyte(s)
TIC	Tentatively Identified Compound
EMPC	Estimated Maximum possible Concentration due to ion ratio failure
ND	Not Detected
K	Result is estimated due to ion ratio failure in High Resolution PCB Analysis
P	RPD > 40% between results of dual columns
D	Spike or surrogate was diluted out in order to achieve a parameter result within instrument calibration range

Samples requiring manual integrations for various congeners and/or standards are marked and dated by the analyst. A code definition is provided below:

M1	Mis-identified peak
M2	Software did not integrate peak
M3	Incorrect baseline construction (i.e. not all of peak included; two peaks integrated as one)
M4	Pattern integration required (i.e. DRO, GRO, PCB, Toxaphene and Technical Chlordane)
M5	Other - Explained in case narrative

Note Results pages that include a value for "Solids (%)" have been adjusted for moisture content.

Laboratory Report of Analysis

To: Matt Brennan
AECOM
8540 Colonnade Center Drive
Suite 306
Raleigh, NC 27615
US

Report Number: **31201091**

Client Project: **NCDOT/Pittsboro**

Dear Matt Brennan,

Enclosed are the results of the analytical services performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. All results are intended to be used in their entirety and SGS is not responsible for use of less than the complete report. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Barbara A. Hager at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America Inc.

Barbara A. Hager
Project Manager
barbara.hager@sgs.com

Date

Laboratory Qualifiers

Report Definitions

DL	Method, Instrument, or Estimated Detection Limit per Analytical Method
CL	Control Limits for the recovery result of a parameter
LOQ	Reporting Limit
DF	Dilution Factor
RPD	Relative Percent Difference
LCS(D)	Laboratory Control Spike (Duplicate)
MS(D)	Matrix Spike (Duplicate)
MB	Method Blank

Qualifier Definitions

*	Recovery or RPD outside of control limits
B	Analyte was detected in the Lab Method Blank at a level above the LOQ
U	Undetected (Reported as ND or < DL)
V	Recovery is below quality control limit. The data has been validated based on a favorable signal-to-noise and detection limit
A	Amount detected is less than the Lower Method Calibration Limit
J	Estimated Concentration.
O	The recovery of this analyte in the OPR is above the Method QC Limits and the reported concentration in the sample may be biased high
E	Amount detected is greater than the Upper Calibration Limit
S	The amount of analyte present has saturated the detector. This situation results in an underestimation of the affected analyte(s)
Q	Indicates the presence of a quantitative interference. This situation may result in an underestimation of the affected analyte(s)
I	Indicates the presence of a qualitative interference that could cause a false positive or an overestimation of the affected analyte(s)
DPE	Indicates the presence of a peak in the polychlorinated diphenylether channel that could cause a false positive or an overestimation of the affected analyte(s)
TIC	Tentatively Identified Compound
EMPC	Estimated Maximum possible Concentration due to ion ratio failure
ND	Not Detected
K	Result is estimated due to ion ratio failure in High Resolution PCB Analysis
P	RPD > 40% between results of dual columns
D	Spike or surrogate was diluted out in order to achieve a parameter result within instrument calibration range

Samples requiring manual integrations for various congeners and/or standards are marked and dated by the analyst. A code definition is provided below:

M1	Mis-identified peak
M2	Software did not integrate peak
M3	Incorrect baseline construction (i.e. not all of peak included; two peaks integrated as one)
M4	Pattern integration required (i.e. DRO, GRO, PCB, Toxaphene and Technical Chlordane)
M5	Other - Explained in case narrative

Note Results pages that include a value for "Solids (%)" have been adjusted for moisture content.

Laboratory Report of Analysis

To: Matt Brennan
AECOM
8540 Colonnade Center Drive
Suite 306
Raleigh, NC 27615
US

Report Number: **31201090**

Client Project: **NCDOT Pittsboro**

Dear Matt Brennan,

Enclosed are the results of the analytical services performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. All results are intended to be used in their entirety and SGS is not responsible for use of less than the complete report. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Barbara A. Hager at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America Inc.

Barbara A. Hager
Project Manager
barbara.hager@sgs.com

Date

Laboratory Qualifiers

Report Definitions

DL	Method, Instrument, or Estimated Detection Limit per Analytical Method
CL	Control Limits for the recovery result of a parameter
LOQ	Reporting Limit
DF	Dilution Factor
RPD	Relative Percent Difference
LCS(D)	Laboratory Control Spike (Duplicate)
MS(D)	Matrix Spike (Duplicate)
MB	Method Blank

Qualifier Definitions

*	Recovery or RPD outside of control limits
B	Analyte was detected in the Lab Method Blank at a level above the LOQ
U	Undetected (Reported as ND or < DL)
V	Recovery is below quality control limit. The data has been validated based on a favorable signal-to-noise and detection limit
A	Amount detected is less than the Lower Method Calibration Limit
J	Estimated Concentration.
O	The recovery of this analyte in the OPR is above the Method QC Limits and the reported concentration in the sample may be biased high
E	Amount detected is greater than the Upper Calibration Limit
S	The amount of analyte present has saturated the detector. This situation results in an underestimation of the affected analyte(s)
Q	Indicates the presence of a quantitative interference. This situation may result in an underestimation of the affected analyte(s)
I	Indicates the presence of a qualitative interference that could cause a false positive or an overestimation of the affected analyte(s)
DPE	Indicates the presence of a peak in the polychlorinated diphenylether channel that could cause a false positive or an overestimation of the affected analyte(s)
TIC	Tentatively Identified Compound
EMPC	Estimated Maximum possible Concentration due to ion ratio failure
ND	Not Detected
K	Result is estimated due to ion ratio failure in High Resolution PCB Analysis
P	RPD > 40% between results of dual columns
D	Spike or surrogate was diluted out in order to achieve a parameter result within instrument calibration range

Samples requiring manual integrations for various congeners and/or standards are marked and dated by the analyst. A code definition is provided below:

M1	Mis-identified peak
M2	Software did not integrate peak
M3	Incorrect baseline construction (i.e. not all of peak included; two peaks integrated as one)
M4	Pattern integration required (i.e. DRO, GRO, PCB, Toxaphene and Technical Chlordane)
M5	Other - Explained in case narrative

Note Results pages that include a value for "Solids (%)" have been adjusted for moisture content.

Laboratory Report of Analysis

To: Matt Brennan
AECOM
8540 Colonnade Center Drive
Suite 306
Raleigh, NC 27615
US

Report Number: **31201636**

Client Project: **NCDOT/Pittsboro**

Dear Matt Brennan,

Enclosed are the results of the analytical services performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. All results are intended to be used in their entirety and SGS is not responsible for use of less than the complete report. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Barbara A. Hager at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America Inc.

Barbara A. Hager
Project Manager
barbara.hager@sgs.com

**ANALYTICAL PERSPECTIVES IS NOW PART OF SGS, THE WORLD'S LEADING INSPECTION,
VERIFICATION, TESTING AND CERTIFICATION COMPANY.**

Laboratory Qualifiers

Report Definitions

DL	Method, Instrument, or Estimated Detection Limit per Analytical Method
CL	Control Limits for the recovery result of a parameter
LOQ	Reporting Limit
DF	Dilution Factor
RPD	Relative Percent Difference
LCS(D)	Laboratory Control Spike (Duplicate)
MS(D)	Matrix Spike (Duplicate)
MB	Method Blank

Qualifier Definitions

*	Recovery or RPD outside of control limits
B	Analyte was detected in the Lab Method Blank at a level above the LOQ
U	Undetected (Reported as ND or < DL)
V	Recovery is below quality control limit. The data has been validated based on a favorable signal-to-noise and detection limit
A	Amount detected is less than the Lower Method Calibration Limit
J	Estimated Concentration.
O	The recovery of this analyte in the OPR is above the Method QC Limits and the reported concentration in the sample may be biased high
E	Amount detected is greater than the Upper Calibration Limit
S	The amount of analyte present has saturated the detector. This situation results in an underestimation of the affected analyte(s)
Q	Indicates the presence of a quantitative interference. This situation may result in an underestimation of the affected analyte(s)
I	Indicates the presence of a qualitative interference that could cause a false positive or an overestimation of the affected analyte(s)
DPE	Indicates the presence of a peak in the polychlorinated diphenylether channel that could cause a false positive or an overestimation of the affected analyte(s)
TIC	Tentatively Identified Compound
EMPC	Estimated Maximum possible Concentration due to ion ratio failure
ND	Not Detected
K	Result is estimated due to ion ratio failure in High Resolution PCB Analysis
P	RPD > 40% between results of dual columns
D	Spike or surrogate was diluted out in order to achieve a parameter result within instrument calibration range

Samples requiring manual integrations for various congeners and/or standards are marked and dated by the analyst. A code definition is provided below:

M1	Mis-identified peak
M2	Software did not integrate peak
M3	Incorrect baseline construction (i.e. not all of peak included; two peaks integrated as one)
M4	Pattern integration required (i.e. DRO, GRO, PCB, Toxaphene and Technical Chlordane)
M5	Other - Explained in case narrative

Note Results pages that include a value for "Solids (%)" have been adjusted for moisture content.

Laboratory Report of Analysis

To: Matt Brennan
AECOM
8540 Colonnade Center Drive
Suite 306
Raleigh, NC 27615
US

Report Number: **31201715**

Client Project: **NCDOT Pittsboro**

Dear Matt Brennan,

Enclosed are the results of the analytical services performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. All results are intended to be used in their entirety and SGS is not responsible for use of less than the complete report. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Barbara A. Hager at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America Inc.

Barbara A. Hager
Project Manager
barbara.hager@sgs.com

**ANALYTICAL PERSPECTIVES IS NOW PART OF SGS, THE WORLD'S LEADING INSPECTION,
VERIFICATION, TESTING AND CERTIFICATION COMPANY.**

Laboratory Qualifiers

Report Definitions

DL	Method, Instrument, or Estimated Detection Limit per Analytical Method
CL	Control Limits for the recovery result of a parameter
LOQ	Reporting Limit
DF	Dilution Factor
RPD	Relative Percent Difference
LCS(D)	Laboratory Control Spike (Duplicate)
MS(D)	Matrix Spike (Duplicate)
MB	Method Blank

Qualifier Definitions

*	Recovery or RPD outside of control limits
B	Analyte was detected in the Lab Method Blank at a level above the LOQ
U	Undetected (Reported as ND or < DL)
V	Recovery is below quality control limit. The data has been validated based on a favorable signal-to-noise and detection limit
A	Amount detected is less than the Lower Method Calibration Limit
J	Estimated Concentration.
O	The recovery of this analyte in the OPR is above the Method QC Limits and the reported concentration in the sample may be biased high
E	Amount detected is greater than the Upper Calibration Limit
S	The amount of analyte present has saturated the detector. This situation results in an underestimation of the affected analyte(s)
Q	Indicates the presence of a quantitative interference. This situation may result in an underestimation of the affected analyte(s)
I	Indicates the presence of a qualitative interference that could cause a false positive or an overestimation of the affected analyte(s)
DPE	Indicates the presence of a peak in the polychlorinated diphenylether channel that could cause a false positive or an overestimation of the affected analyte(s)
TIC	Tentatively Identified Compound
EMPC	Estimated Maximum possible Concentration due to ion ratio failure
ND	Not Detected
K	Result is estimated due to ion ratio failure in High Resolution PCB Analysis
P	RPD > 40% between results of dual columns
D	Spike or surrogate was diluted out in order to achieve a parameter result within instrument calibration range

Samples requiring manual integrations for various congeners and/or standards are marked and dated by the analyst. A code definition is provided below:

M1	Mis-identified peak
M2	Software did not integrate peak
M3	Incorrect baseline construction (i.e. not all of peak included; two peaks integrated as one)
M4	Pattern integration required (i.e. DRO, GRO, PCB, Toxaphene and Technical Chlordane)
M5	Other - Explained in case narrative

Note Results pages that include a value for "Solids (%)" have been adjusted for moisture content.

Laboratory Report of Analysis

To: Matt Brennan
AECOM
8540 Colonnade Center Drive
Suite 306
Raleigh, NC 27615
US

Report Number: **31201635**

Client Project: **NCDOT/Pittsboro**

Dear Matt Brennan,

Enclosed are the results of the analytical services performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. All results are intended to be used in their entirety and SGS is not responsible for use of less than the complete report. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Barbara A. Hager at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America Inc.

Barbara A. Hager
Project Manager
barbara.hager@sgs.com

Date

Laboratory Qualifiers

Report Definitions

DL	Method, Instrument, or Estimated Detection Limit per Analytical Method
CL	Control Limits for the recovery result of a parameter
LOQ	Reporting Limit
DF	Dilution Factor
RPD	Relative Percent Difference
LCS(D)	Laboratory Control Spike (Duplicate)
MS(D)	Matrix Spike (Duplicate)
MB	Method Blank

Qualifier Definitions

*	Recovery or RPD outside of control limits
B	Analyte was detected in the Lab Method Blank at a level above the LOQ
U	Undetected (Reported as ND or < DL)
V	Recovery is below quality control limit. The data has been validated based on a favorable signal-to-noise and detection limit
A	Amount detected is less than the Lower Method Calibration Limit
J	Estimated Concentration.
O	The recovery of this analyte in the OPR is above the Method QC Limits and the reported concentration in the sample may be biased high
E	Amount detected is greater than the Upper Calibration Limit
S	The amount of analyte present has saturated the detector. This situation results in an underestimation of the affected analyte(s)
Q	Indicates the presence of a quantitative interference. This situation may result in an underestimation of the affected analyte(s)
I	Indicates the presence of a qualitative interference that could cause a false positive or an overestimation of the affected analyte(s)
DPE	Indicates the presence of a peak in the polychlorinated diphenylether channel that could cause a false positive or an overestimation of the affected analyte(s)
TIC	Tentatively Identified Compound
EMPC	Estimated Maximum possible Concentration due to ion ratio failure
ND	Not Detected
K	Result is estimated due to ion ratio failure in High Resolution PCB Analysis
P	RPD > 40% between results of dual columns
D	Spike or surrogate was diluted out in order to achieve a parameter result within instrument calibration range

Samples requiring manual integrations for various congeners and/or standards are marked and dated by the analyst. A code definition is provided below:

M1	Mis-identified peak
M2	Software did not integrate peak
M3	Incorrect baseline construction (i.e. not all of peak included; two peaks integrated as one)
M4	Pattern integration required (i.e. DRO, GRO, PCB, Toxaphene and Technical Chlordane)
M5	Other - Explained in case narrative

Note Results pages that include a value for "Solids (%)" have been adjusted for moisture content.

Sample Summary

<u>Client Sample ID</u>	<u>Lab Sample ID</u>	<u>Collected</u>	<u>Received</u>	<u>Matrix</u>
Spent Carbon-01	31201635001	05/24/2012 08:40	05/25/2012 16:00	Soil-Solid as dry weight
Spent Carbon-02	31201635002	05/24/2012 09:00	05/25/2012 16:00	Soil-Solid as dry weight

Detectable Results Summary

Client Sample ID: **Spent Carbon-01**

Lab Sample ID: 31201635001-D

SW-846 8260B

<u>Parameter</u>	<u>Result</u>	<u>Units</u>
1,1,1-Trichloroethane	183	ug/Kg
1,1-Dichloroethene	298	ug/Kg
Trichloroethene	5090	ug/Kg

Client Sample ID: **Spent Carbon-02**

Lab Sample ID: 31201635002-D

SW-846 8260B

<u>Parameter</u>	<u>Result</u>	<u>Units</u>
1,1,1-Trichloroethane	282	ug/Kg
1,1-Dichloroethane	197	ug/Kg
1,1-Dichloroethene	582	ug/Kg
Chloromethane	142	ug/Kg
Trichloroethene	4900	ug/Kg
cis-1,2-Dichloroethene	228	ug/Kg

Results of Spent Carbon-01

Client Sample ID: **Spent Carbon-01**
 Client Project ID: **NCDOT/Pittsboro**
 Lab Sample ID: 31201635001-D
 Lab Project ID: 31201635

Collection Date: 05/24/2012 08:40
 Received Date: 05/25/2012 16:00
 Matrix: Soil-Solid as dry weight
 Solids (%): 59.90

Laboratory Report of Analysis

To: Matt Brennan
8540 Colonnade Center Drive
Suite 306
Raleigh, NC 27615

Report Number: **31201985**

Client Project: **NCDOT Pittsboro**

Dear Matt Brennan,

Enclosed are the results of the analytical services performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. All results are intended to be used in their entirety and SGS is not responsible for use of less than the complete report. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Barbara A. Hager at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America Inc.

Barbara A. Hager
Project Manager
barbara.hager@sgs.com

Laboratory Qualifiers

Report Definitions

DL	Method, Instrument, or Estimated Detection Limit per Analytical Method
CL	Control Limits for the recovery result of a parameter
LOQ	Reporting Limit
DF	Dilution Factor
RPD	Relative Percent Difference
LCS(D)	Laboratory Control Spike (Duplicate)
MS(D)	Matrix Spike (Duplicate)
MB	Method Blank

Qualifier Definitions

*	Recovery or RPD outside of control limits
B	Analyte was detected in the Lab Method Blank at a level above the LOQ
U	Undetected (Reported as ND or < DL)
V	Recovery is below quality control limit. The data has been validated based on a favorable signal-to-noise and detection limit
A	Amount detected is less than the Lower Method Calibration Limit
J	Estimated Concentration.
O	The recovery of this analyte in the OPR is above the Method QC Limits and the reported concentration in the sample may be biased high
E	Amount detected is greater than the Upper Calibration Limit
S	The amount of analyte present has saturated the detector. This situation results in an underestimation of the affected analyte(s)
Q	Indicates the presence of a quantitative interference. This situation may result in an underestimation of the affected analyte(s)
I	Indicates the presence of a qualitative interference that could cause a false positive or an overestimation of the affected analyte(s)
DPE	Indicates the presence of a peak in the polychlorinated diphenylether channel that could cause a false positive or an overestimation of the affected analyte(s)
TIC	Tentatively Identified Compound
EMPC	Estimated Maximum possible Concentration due to ion ratio failure
ND	Not Detected
K	Result is estimated due to ion ratio failure in High Resolution PCB Analysis
P	RPD > 40% between results of dual columns
D	Spike or surrogate was diluted out in order to achieve a parameter result within instrument calibration range

Samples requiring manual integrations for various congeners and/or standards are marked and dated by the analyst. A code definition is provided below:

M1	Mis-identified peak
M2	Software did not integrate peak
M3	Incorrect baseline construction (i.e. not all of peak included; two peaks integrated as one)
M4	Pattern integration required (i.e. DRO, GRO, PCB, Toxaphene and Technical Chlordane)
M5	Other - Explained in case narrative

Note Results pages that include a value for "Solids (%)" have been adjusted for moisture content.

Laboratory Report of Analysis

To: Matt Brennan
AECOM
8540 Colonnade Center Drive
Suite 306
Raleigh, NC 27615
US

Report Number: **31202399**

Client Project: **Pittsboro**

Dear Matt Brennan,

Enclosed are the results of the analytical services performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. All results are intended to be used in their entirety and SGS is not responsible for use of less than the complete report. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Barbara A. Hager at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America Inc.

Barbara A. Hager
Project Manager
barbara.hager@sgs.com

Laboratory Qualifiers

Report Definitions

DL	Method, Instrument, or Estimated Detection Limit per Analytical Method
CL	Control Limits for the recovery result of a parameter
LOQ	Reporting Limit
DF	Dilution Factor
RPD	Relative Percent Difference
LCS(D)	Laboratory Control Spike (Duplicate)
MS(D)	Matrix Spike (Duplicate)
MB	Method Blank

Qualifier Definitions

*	Recovery or RPD outside of control limits
B	Analyte was detected in the Lab Method Blank at a level above the LOQ
U	Undetected (Reported as ND or < DL)
V	Recovery is below quality control limit. The data has been validated based on a favorable signal-to-noise and detection limit
A	Amount detected is less than the Lower Method Calibration Limit
J	Estimated Concentration.
O	The recovery of this analyte in the OPR is above the Method QC Limits and the reported concentration in the sample may be biased high
E	Amount detected is greater than the Upper Calibration Limit
S	The amount of analyte present has saturated the detector. This situation results in an underestimation of the affected analyte(s)
Q	Indicates the presence of a quantitative interference. This situation may result in an underestimation of the affected analyte(s)
I	Indicates the presence of a qualitative interference that could cause a false positive or an overestimation of the affected analyte(s)
DPE	Indicates the presence of a peak in the polychlorinated diphenylether channel that could cause a false positive or an overestimation of the affected analyte(s)
TIC	Tentatively Identified Compound
EMPC	Estimated Maximum possible Concentration due to ion ratio failure
ND	Not Detected
K	Result is estimated due to ion ratio failure in High Resolution PCB Analysis
P	RPD > 40% between results of dual columns
D	Spike or surrogate was diluted out in order to achieve a parameter result within instrument calibration range

Samples requiring manual integrations for various congeners and/or standards are marked and dated by the analyst. A code definition is provided below:

M1	Mis-identified peak
M2	Software did not integrate peak
M3	Incorrect baseline construction (i.e. not all of peak included; two peaks integrated as one)
M4	Pattern integration required (i.e. DRO, GRO, PCB, Toxaphene and Technical Chlordane)
M5	Other - Explained in case narrative

Note Results pages that include a value for "Solids (%)" have been adjusted for moisture content.

Sample Summary

<u>Client Sample ID</u>	<u>Lab Sample ID</u>	<u>Collected</u>	<u>Received</u>	<u>Matrix</u>
Sanders-072712	31202399001	07/27/2012 17:45	07/30/2012 15:41	Water
Trip Blank (Not on COC)	31202399002	07/27/2012 00:00	07/30/2012 15:41	Water

Case Narrative

LCS for HBN 26311 [VXX/3740]

8260 - The reported recoveries for Bromomethane and Methylene Chloride are above the QC limits.

LCSD for HBN 26311 [VXX/3740]

8260 - The reported recoveries for Bromomethane and Methylene Chloride are above the QC limits.

Trip Blank (Not on COC)

8260 - This Trip Blank has a reported 'J' concentration for Methylene Chloride.

Laboratory Report of Analysis

To: Matt Brennan
AECOM
8540 Colonnade Center Drive
Suite 306
Raleigh, NC 27615
US

Report Number: **31202456**

Client Project: **NCDOT Pittsboro**

Dear Matt Brennan,

Enclosed are the results of the analytical services performed under the referenced project for the received samples and associated QC as applicable. The samples are certified to meet the requirements of the National Environmental Laboratory Accreditation Conference Standards. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. All results are intended to be used in their entirety and SGS is not responsible for use of less than the complete report. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or services performed during this project, please call Barbara A. Hager at (910) 350-1903. We will be happy to answer any questions or concerns which you may have.

Thank you for using SGS North America Inc. for your analytical services. We look forward to working with you again on any additional analytical needs.

Sincerely,
SGS North America Inc.

Barbara A. Hager
Project Manager
barbara.hager@sgs.com

Laboratory Qualifiers

Report Definitions

DL	Method, Instrument, or Estimated Detection Limit per Analytical Method
CL	Control Limits for the recovery result of a parameter
LOQ	Reporting Limit
DF	Dilution Factor
RPD	Relative Percent Difference
LCS(D)	Laboratory Control Spike (Duplicate)
MS(D)	Matrix Spike (Duplicate)
MB	Method Blank

Qualifier Definitions

*	Recovery or RPD outside of control limits
B	Analyte was detected in the Lab Method Blank at a level above the LOQ
U	Undetected (Reported as ND or < DL)
V	Recovery is below quality control limit. The data has been validated based on a favorable signal-to-noise and detection limit
A	Amount detected is less than the Lower Method Calibration Limit
J	Estimated Concentration.
O	The recovery of this analyte in the OPR is above the Method QC Limits and the reported concentration in the sample may be biased high
E	Amount detected is greater than the Upper Calibration Limit
S	The amount of analyte present has saturated the detector. This situation results in an underestimation of the affected analyte(s)
Q	Indicates the presence of a quantitative interference. This situation may result in an underestimation of the affected analyte(s)
I	Indicates the presence of a qualitative interference that could cause a false positive or an overestimation of the affected analyte(s)
DPE	Indicates the presence of a peak in the polychlorinated diphenylether channel that could cause a false positive or an overestimation of the affected analyte(s)
TIC	Tentatively Identified Compound
EMPC	Estimated Maximum possible Concentration due to ion ratio failure
ND	Not Detected
K	Result is estimated due to ion ratio failure in High Resolution PCB Analysis
P	RPD > 40% between results of dual columns
D	Spike or surrogate was diluted out in order to achieve a parameter result within instrument calibration range

Samples requiring manual integrations for various congeners and/or standards are marked and dated by the analyst. A code definition is provided below:

M1	Mis-identified peak
M2	Software did not integrate peak
M3	Incorrect baseline construction (i.e. not all of peak included; two peaks integrated as one)
M4	Pattern integration required (i.e. DRO, GRO, PCB, Toxaphene and Technical Chlordane)
M5	Other - Explained in case narrative

Note Results pages that include a value for "Solids (%)" have been adjusted for moisture content.

Sample Summary

<u>Client Sample ID</u>	<u>Lab Sample ID</u>	<u>Collected</u>	<u>Received</u>	<u>Matrix</u>

Trip Blank	31202456002	08/01/2012 00:00	08/03/2012 09:50	Water

Case Narrative

LCS for HBN 26417 [VXX/3757]

8260 - The method blank associated with batch VMS2440 has a reported 'J' concentration for Methylene Chloride.

LCSD for HBN 26417 [VXX/3757]

8260 - The method blank associated with batch VMS2440 has a reported 'J' concentration for Methylene Chloride.

MB for HBN 26417 [VXX/3757]

8260 - The method blank associated with batch VMS2440 has a reported 'J' concentration for Methylene Chloride.

Mitchell-080112

8260 - The method blank associated with batch VMS2440 has a reported 'J' concentration for Methylene Chloride.

TCLP-B for HBN 26376 [LCH/1274]

8260 - The method blank associated with batch VMS2440 has a reported 'J' concentration for Methylene Chloride.

Trip Blank

8260 - The method blank associated with batch VMS2440 has a reported 'J' concentration for Methylene Chloride.

UST1115-MW07(82633MS)

8260 - The method blank associated with batch VMS2440 has a reported 'J' concentration for Methylene Chloride.

UST1115-MW07(82633MSD)

8260 - The method blank associated with batch VMS2440 has a reported 'J' concentration for Methylene Chloride.

Memorandum

To	Chris Mason – AECOM Raleigh	Page	1
CC			
Subject	Level 2 Data Validation for NCDOT-Pittsboro Groundwater Samples		
From	Robert Davis – AECOM Atlanta		
Date	May 1, 2012		

Limited validation was performed on one data package from SGS Environmental Services in Wilmington, North Carolina for groundwater samples. The samples were collected at the NCDOT site in Pittsboro, North Carolina on April 11-12, 2012.

The data were reviewed for conformance to method specifications and the validation criteria set forth in the *USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review*, USEPA-540-R-07-003, July 2008, with additional reference to *USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review*, EPA 540/R-99-008, May 1999 as they applied to the methodology used. Inorganic data were evaluated based on method specifications and the validation criteria set forth in the *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, EPA-540-R-04-004, January 2010, as they applied to the analytical methods employed. Field duplicate RPD control limits were taken from the *USEPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses*, February 1988, upheld in DRAFT 1993.

The following analytical methods were requested on the chain-of-custody records (COCs):

- Method 8260B – Volatile Organic Compounds (VOC) by Gas Chromatography/Mass Spectrometry (GC/MS).

Review Elements

Sample data were reviewed for the following parameters:

- Agreement of analyses conducted with chain-of-custody (COC) requests
- Holding times/sample preservation
- Method blanks/trip blanks
- Surrogate results

- Laboratory control sample (LCS) results
- Matrix spike/matrix spike duplicate (MS/MSD) results
- Field precision results

Samples

AECOM Environment collected the following groundwater samples from the NCDOT site in Pittsboro, North Carolina.

31201090

Lab ID	Sample ID	Lab ID	Sample ID
31201090001	48MW-17	31201090016	48MW-10
31201090002	48MW-4R	31201090017	48MW-5
31201090003	48DW-1	31201090018	48SW-1
31201090004	48MW-15	31201090019	48MW-11R
31201090005	48DW-4	31201090020	48MW-16
31201090006	48MW-12	31201090021	48MW-1
31201090007	48MW-14	31201090022	48DW-6
31201090008	48MW-3	31201090023	48DUP-1
31201090009	48DW-3	31201090024	48DW-7
31201090010	48MW-2	31201090025	48DW-8
31201090011	48EB-1	31201090026	48DW-2
31201090012	48PW-2	31201090027	48DW-5
31201090013	48RW-1	31201090028	48SVE-01
31201090014	48RW-2	31201090029	48EB-02
31201090015	48MW-13	31201090030	Trip Blank

Analytical Results

In general, the data are valid as reported and may be used for decision making purposes. Sample data are qualified with "UJ" (The analyte was not detected; however, the reported quantitation limit is approximated and may be inaccurate or imprecise). See Table 1.

Method 8260B: Samples 48RW-1, 48RW-2, 48MW-16, 48DW-8, 48DW-5, and 38SVE-01 required analysis at a dilution in order to bring several of the compound concentrations into the calibration range, resulting in elevated detection limits.

Discussion

Agreement of Analyses Conducted with COC Requests

Laboratory sample reports were checked to verify that the results corresponded to analytical requests as designated on the COC. No discrepancies were noted.

Holding Times and Preservation

All samples were analyzed within the holding times required by the methods.

The sample cooler temperature upon receipt was within the acceptable range of 4 ± 2 °C.

All samples that required chemical preservation were chemically preserved to the proper pH.

Method Blanks/Trip Blanks

No analytes were detected at concentrations exceeding the reporting limits for the method blanks or trip blanks.

Surrogate Results

The surrogate recoveries were acceptable for all organic analyses.

Laboratory Control Sample Results

Laboratory control standards (LCS) for all of the analyses were within the quality control limits with the following exceptions:

HBN 22514 Method 8260B: The LCSD recoveries were outside of the quality control limits biased high for 1,1,1-Trichloroethane and Carbon tetrachloride. All of the associated samples were non-detect for 1,1,1-Trichloroethane and Carbon tetrachloride; therefore, data qualification was not required.

Matrix Spike/Matrix Spike Duplicate Results

Matrix spike and matrix spike duplicates that were performed on non-project samples were not evaluated because matrix similarity to project samples could not be assumed.

The matrix spike/matrix spike duplicate (MS/MSD) recoveries and precision on client samples were all within the advisory limits with the following exceptions:

Method 8260B: The MS/MSD recoveries for 1,1,1-Trichloroethane in sample 48MW-16 were outside of the quality control limit biased high. Sample 48MW-16 was non-detect for 1,1,1-Trichloroethane; therefore, data qualification was not required.

Method 8260B: The MS recovery for o-Xylene in sample 48MW-16 was outside of the quality control limits biased low. The o-Xylene result for sample 48MW-16 was qualified. See Table 1.

Field Precision Results

A field duplicate was collected on sample 48MW-1. See Table 2 for the Relative Percent Differences (RPDs) for all compounds for which there were detections. The RPDs between the original and field duplicates were all within the acceptance criteria of 30%.

Table 1
Qualified Analytical Data

Sample ID	Method	Analyte	Lab Result	Lab Qualifier	Validated Result	Validation Qualifier ¹	Units	Reason Codes ²
48MW-16	8260B	o-Xylene	ND		20	UJ	µg/L	MS

¹: USEPA-defined data validation qualifiers applied in this data evaluation:

UJ: The analyte was not detected; however, the reported quantitation limit is approximated and may be inaccurate or imprecise.

²: Reason Codes:

MS: The matrix spike recovery was outside of the quality control limits.

Table 2

Field Precision

Method	Compound	48-MW-1	48DUP-1	Units	% RPD
8260B	1,1-Dichloroethene	2.22	2.22	µg/L	0
8260B	Tetrachloroethene	1.61	1.48	µg/L	8.4
8260B	Trichloroethene	16.2	16.1	µg/L	0.62

% RPD: Relative percent difference between the primary sample result and the sample duplicate result.

Date	June 20, 2012		

Limited validation was performed on one data package from SGS Environmental Services in Wilmington, North Carolina for groundwater samples. The samples were collected at the NCDOT site in Pittsboro, North Carolina on May 31, 2012.

The data were reviewed for conformance to method specifications and the validation criteria set forth in the *USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review*, USEPA-540-R-07-003, July 2008, with additional reference to *USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review*, EPA 540/R-99-008, May 1999 as they applied to the methodology used. Inorganic data were evaluated based on method specifications and the validation criteria set forth in the *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, EPA-540-R-04-004, January 2010, as they applied to the analytical methods employed. Field duplicate RPD control limits were taken from the *USEPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses*, February 1988, upheld in DRAFT 1993.

The following analytical methods were requested on the chain-of-custody records (COCs):

- Method 8260B – Volatile Organic Compounds (VOC) by Gas Chromatography/Mass Spectrometry (GC/MS).

Review Elements

Sample data were reviewed for the following parameters:

- Agreement of analyses conducted with chain-of-custody (COC) requests
- Holding times/sample preservation
- Method blanks/trip blanks
- Surrogate results

- Laboratory control sample (LCS) results
- Matrix spike/matrix spike duplicate (MS/MSD) results
- Field precision results

Samples

AECOM Environment collected the following groundwater samples from the NCDOT site in Pittsboro, North Carolina.

31201715

Lab ID	Sample ID	Lab ID	Sample ID
31201715001	48DW-8 (90)	31201715004	48SVE-01 (1030)
31201715002	48DW-8 (40)	31201715009	TB-01
31201715003	48SVE-01 (1010)	31201715010	TB-02

Analytical Results

In general, the data are valid as reported and may be used for decision making purposes. Sample data are qualified with "UJ" (The analyte was not detected; however, the reported quantitation limit is approximated and may be inaccurate or imprecise). See Table 1.

Method 8260B: Samples 48DW-8(90), 48DW-8(40), 48SVE-01(1010), and 48SVE-01(1030) required analysis at a dilution in order to bring several of the compound concentrations into the calibration range, resulting in elevated detection limits.

Discussion

Agreement of Analyses Conducted with COC Requests

Laboratory sample reports were checked to verify that the results corresponded to analytical requests as designated on the COC. No discrepancies were noted.

Holding Times and Preservation

All samples were analyzed within the holding times required by the methods.

The sample cooler temperature upon receipt was outside the acceptable range of 4±2 °C at 0.2 °C. None of the samples were received broken or frozen by the laboratory. Based on professional judgment, data qualification was not required.

All samples that required chemical preservation were chemically preserved to the proper pH.

Method Blanks/Trip Blanks

No analytes were detected at concentrations exceeding the reporting limits for the method blanks or trip blanks.

Surrogate Results

The surrogate recoveries were acceptable for all organic analyses.

Laboratory Control Sample Results

Laboratory control standards (LCS) for all of the analyses were within the quality control limits with the following exceptions:

HBN 24310 Method 8260B: The LCS/LCSD recoveries were outside of the quality control limits biased high for Bromomethane. All of the associated samples were non-detect for Bromomethane; therefore, data qualification was not required.

HBN 24310 Method 8260B: The LCS/LCSD recoveries were outside of the quality control limits biased low for 4-Chlorotoluene. All of the associated samples were qualified. See Table 1.

HBN 24409 Method 8260B: The LCS recovery was outside of the quality control limits biased high for 1,2,3-Trichloropropane. All of the associated samples were non-detect for 1,2,3-Trichloropropane; therefore, data qualification was not required.

Matrix Spike/Matrix Spike Duplicate Results

Matrix spike and matrix spike duplicates that were performed on non-project samples were not evaluated because matrix similarity to project samples could not be assumed.

The matrix spike/matrix spike duplicate (MS/MSD) recoveries and precision on client samples were all within the advisory limits.

Field Precision Results

A field duplicate was not collected for this sample set.

Table 1
Qualified Analytical Data

Sample ID	Method	Analyte	Lab Result	Lab Qual.	Validated Result	Validation Qualifier ¹	Units	Reason Codes ²
48SVE-01(1010)	8260B	4-Chlorotoluene	ND		1600	UJ	µg/L	LCS
48SVE-01(1030)	8260B	4-Chlorotoluene	ND		1250	UJ	µg/L	LCS

1: USEPA-defined data validation qualifiers applied in this data evaluation:

UJ: The analyte was not detected; however, the reported quantitation limit is approximated and may be inaccurate or imprecise.

2: Reason Codes:

LCS: The laboratory control spike recovery was outside of the quality control limits.

About AECOM

AECOM (NYSE: ACM) is a global provider of professional technical and management support services to a broad range of markets, including transportation, facilities, environmental, energy, water and government. With approximately 45,000 employees around the world, AECOM is a leader in all of the key markets that it serves. AECOM provides a blend of global reach, local knowledge, innovation, and collaborative technical excellence in delivering solutions that enhance and sustain the world's built, natural, and social environments. A *Fortune 500* company, AECOM serves clients in more than 130 countries and has annual revenue in excess of \$8.0 billion.

More information on AECOM and its services can be found at www.aecom.com.
