

Chatham County Wastewater Management as it Relates to Comprehensive Plan

19 January 2017

Victor D'Amato, PE

Senior Engineer & VP

Tetra Tech Engineering, P.C.

Outline

- Introduction
 - Tetra Tech
 - Wastewater management approaches
- Experience in other communities
 - NC Piedmont water quality impacts
 - WERF case studies
- Paths forward
 - Status quo
 - Distributed wastewater planning/implementation

Tetra Tech

- Tetra Tech is a US consulting firm with 400 offices in 20 countries
 - #1 in Water for 13 years (ENR)
 - Developed USEPA's decentralized (and much centralized) wastewater guidance
 - RTP office opened in 1996 and includes 18 scientists, engineers, and planners
 - Developed latest Jordan Lake water quality model
- Vic manages engineering group
 - Lives on Crows Creek off Jones Ferry Rd. and on Chatham ERAC since 2009
 - Have worked on both centralized and decentralized wastewater entire career
 - Relevant projects with NC DEQ, Chesapeake Bay Program, Chatham County Schools, others

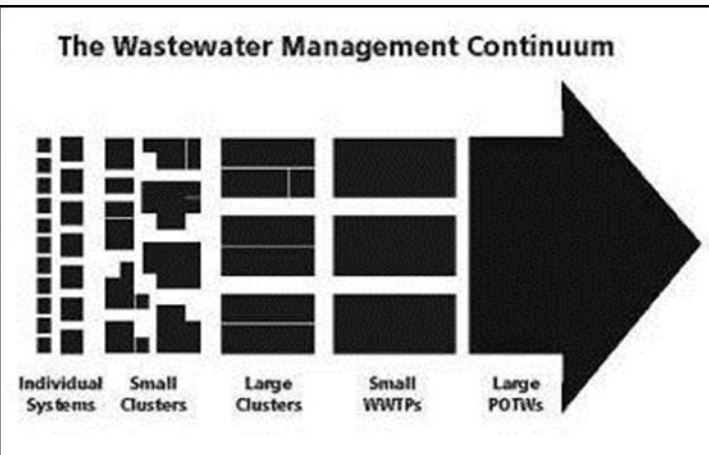

Wastewater Treatment Options

- Individual onsite (“septic”) or advanced wastewater treatment systems
- Small/large clustered systems with soil infiltration or effluent reuse
- Small “package” plants with ditch/stream discharge
- Large centralized plant with lake/river/ocean discharge

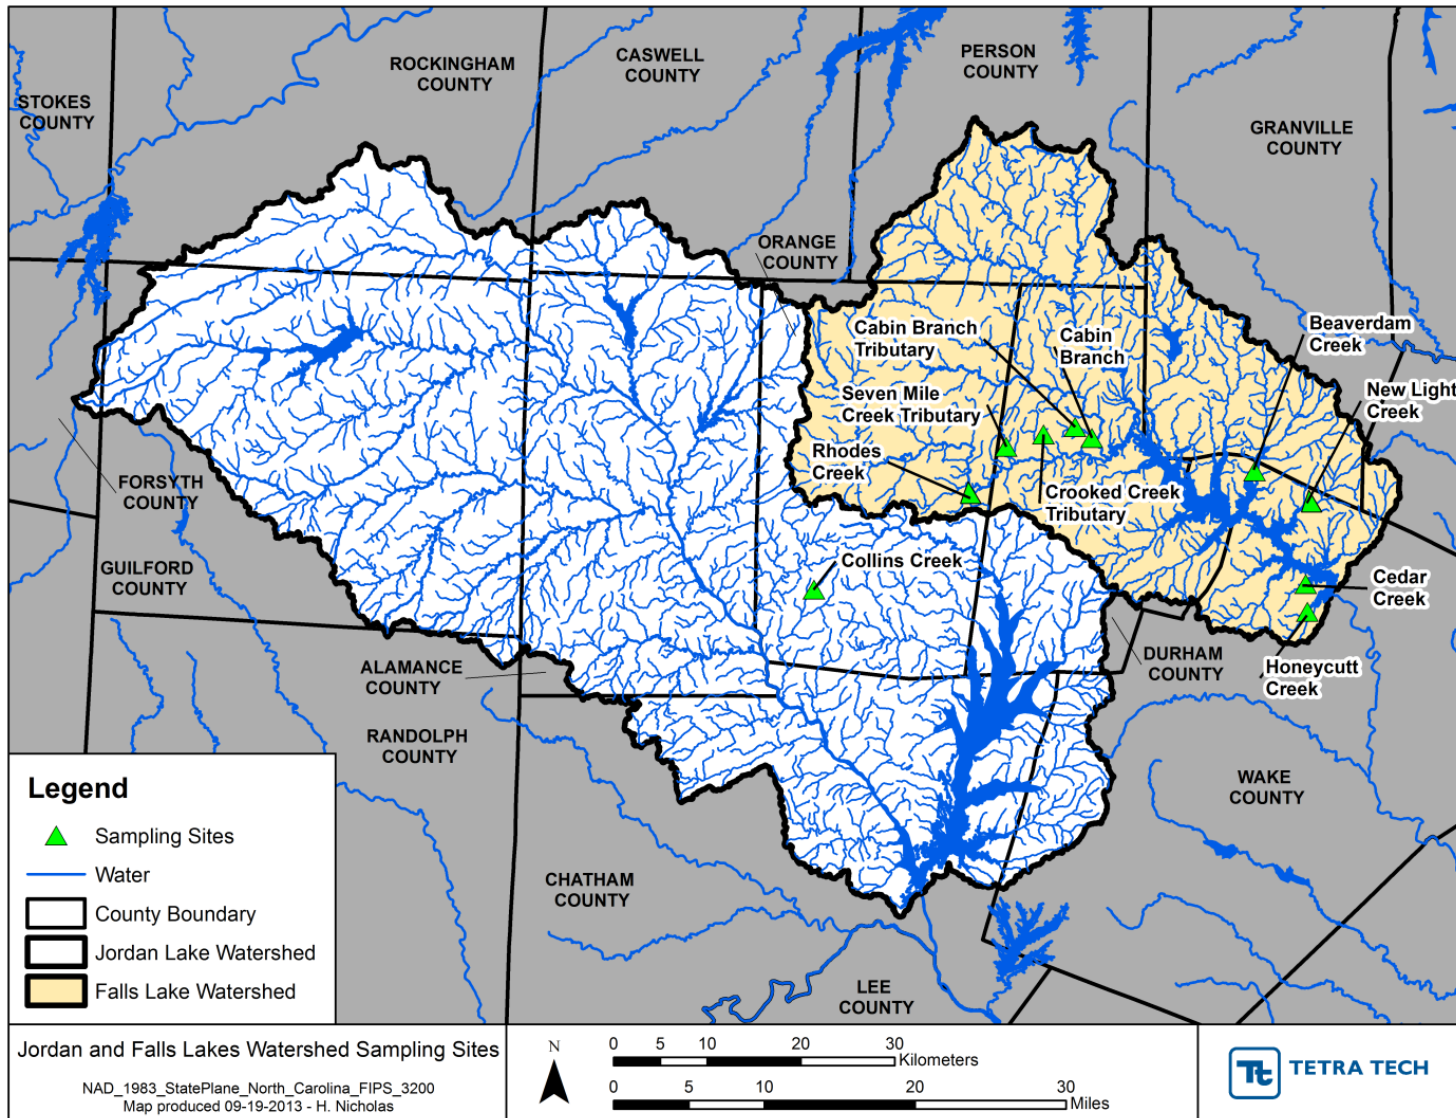

Decentralized Systems and Distributed Management

- **Decentralized systems:** multiple smaller systems
 - Onsite
 - Cluster
- **Distributed management:** all of the above
 - Recognizes the importance of scale in managing water
 - Small systems can be as or more effective than large ones
 - **Recognizes that ALL systems need to be managed**

Are Septic Systems Effective in the Piedmont?

NC Piedmont Onsite System Performance

| Basin | Stream Order* | Septic-Generated Nutrients | | Measured Load in Stream | | Percent Septic Load Delivered to Stream | |
|------------------|-----------------|----------------------------|----------------------------|----------------------------|----------------------------|---|------------|
| | | TN (lb/d/mi ²) | TP (lb/d/mi ²) | TN (lb/d/mi ²) | TP (lb/d/mi ²) | TN (%) | TP (%) |
| Rhodes Creek | unk. | - | - | 0.57 | 0.012 | - | - |
| Seven-Mile Creek | 4 th | 30.4 | 3.9 | 0.139 | 0.0068 | 0.46 | 0.18 |
| Cabin Branch | 8 th | 30.2 | 3.86 | 0.57 | 0.0178 | 1.89 | 0.46 |
| Crooked Creek | 2 nd | 27.0 | 3.45 | 1.53 | 0.0286 | 5.67 | 0.83 |
| Beaverdam Creek | unk. | 3.83 | 0.42 | 0.20 | 0.024 | 5.1 | 5.7 |
| New Light Creek | unk. | 4.68 | 0.60 | 0.37 | 0.033 | 8.0 | 5.4 |
| Honeycut Creek | unk. | 15.5 | 1.99 | 0.33 | 0.025 | 2.2 | 1.3 |
| Cedar Creek | unk. | 29.7 | 3.81 | 0.66 | 0.039 | 2.2 | 1.0 |
| AVERAGE | | 20.2 | 2.6 | 0.55 | 0.023 | 3.6 | 2.1 |

- Equivalent “effluent” concentrations: 2.0 mg/l TN, 0.2 mg/l TP
- Equivalent reductions: 96% TN, 98% TP
- Corroborated by more recent USGS and ECU data and ChesBay Program work

Data from:
 NCDENR 2010
 Berkowitz 2014

Decentralized Soil-Based Treatment can be Effective

- Decentralized technologies are robust
- Multiple soil dispersal areas enhance assimilation
- Conserves water/restores local hydrology through groundwater recharge
- Soil is an effective treatment medium

Distributed System Applications

- **Green Buildings/Sustainable Sites**
 - Integration into buildings/landscapes
 - Resource recovery and reuse
 - Education and recreation
- **Independent Communities**
 - Maintain fiscal control
 - Preserve community character
 - Underserved communities
- **Utility Optimization**
 - Managed distributed systems
 - Sewer mining
 - Satellite reuse
- www.werf.org/distributedwater
 - Includes decision-support tool

| Case Studies Listed by Type |
|--|
| Green Building/Sustainable Sites (GB) |
| Battery Park City, New York City (UO) |
| Couran Cove Island Resort, Queensland, Australia (IC) |
| Currumbin Ecovillage, Queensland, Australia (IC) |
| Dockside Green, Victoria, British Columbia, Canada (UO) |
| Philip Merrill Center, Annapolis, Maryland |
| Sidwell Friends School, Washington, D.C. |
| Workplace6 Recycled Water Factory, Sydney, Australia (UO) |
| Independent Communities (IC) |
| Bethel Heights, Arkansas |
| Gillette Stadium, Foxborough, Massachusetts (GB) |
| Lake Elmo, Minnesota |
| Piperton, Tennessee |
| Warren, Vermont |
| Weston Solar Aquatics, Weston, Massachusetts (GB) |
| Wickford Village, Rhode Island |
| Utility Optimization (UO) |
| LOTT Alliance, Lacey, Olympia, and Tumwater, Washington |
| Loudoun Water, Loudoun County, Virginia (IC) |
| Mobile Area Water and Sewer System, Mobile, Alabama |
| Pennant Hills Golf Club, Sydney, Australia |
| Sand Creek, Aurora, Colorado |
| University of North Carolina at Chapel Hill, North Carolina (GB) |

Distributed System Applications

- **MAWSS, Mobile Alabama**

- Owns and operates two conventional and at least 12 decentralized wastewater facilities

- **Sydney Water**

- Privately-driven *sewer mining* project
- Treated water is used to irrigate 55 acres of greens, tees and fairways

- **Bethel Heights, Arkansas**

- Rapidly-growing population on septic systems
- City selected two cluster systems phased-in to meet increasing demand with growth

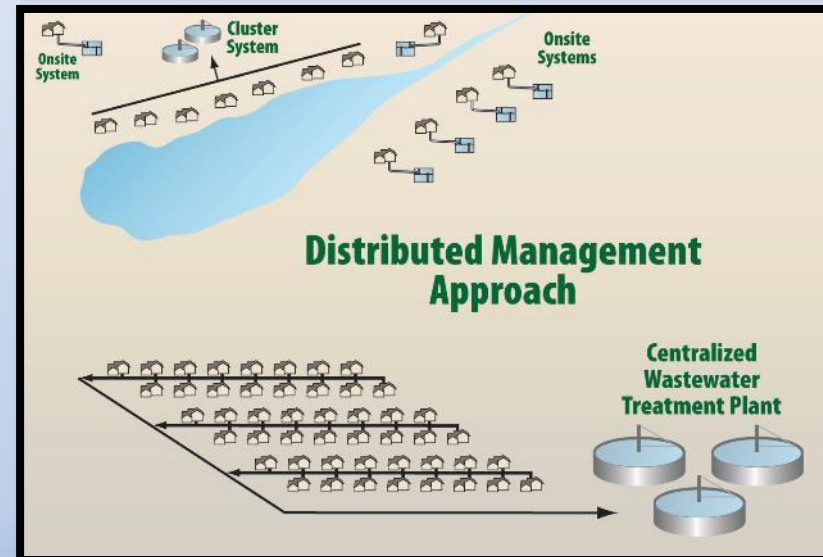

- **Dockside Green, Victoria, B.C.**

- On-site, closed-loop treatment provides *fit-for-purpose*, reclaimed water supply
 - Toilet flushing, landscape irrigation, green roof watering, and natural stream/pond

Case Study Benefits: Efficiency

- Treatment close to the source and/or reuse requires less energy
- Urban reuse retrofits are more feasible
- *Smart, clean and green* technology
 - Smart
 - Remote monitoring of multiple systems
 - Responsive to user feedback
 - Clean
 - **Resource recovery** within facilities
 - Match water quality to intended reuse (Fit-for-Purpose)
 - Green
 - Efficient/passive ecological treatment
 - **Multifunctional**: Landscape/facility integration
 - Relatively infiltration-resistant

Energy Efficiency

Electrical energy demand for 5,000 gpd decentralized reuse systems

| System Type | Reuses | Power | Units |
|--|------------------|----------------|--------------|
| Conventional Gravity Septic System | Aquifer Recharge | 0.0 | kWh/MG |
| Pumped / Pressurized Drainfield System | Aquifer Recharge | 200.0 | kWh/MG |
| Gravity Collection to Recirculating Filter | Irrigation | 520.0 | kWh/MG |
| Gravity Collection to RF and UV Disinfection | Unrestricted | 580.0 | kWh/MG |
| Pressure Sewer to RF and UV | Unrestricted | 780.0 | kWh/MG |
| California WWTPs (CEC, 2005) | Not Specified | 1,500 to 5,800 | kWh/MG |

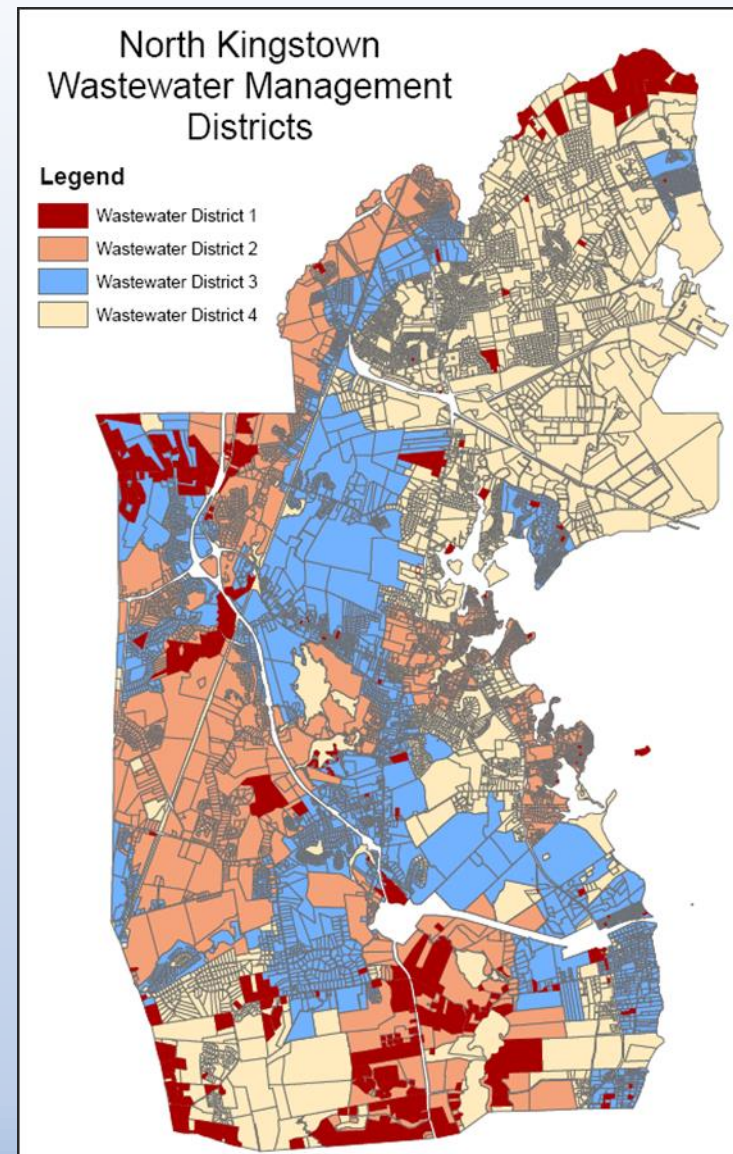

Case Study Benefits: Affordability

“Pay as You Grow” or “Right-Sized, Just-in-Time”

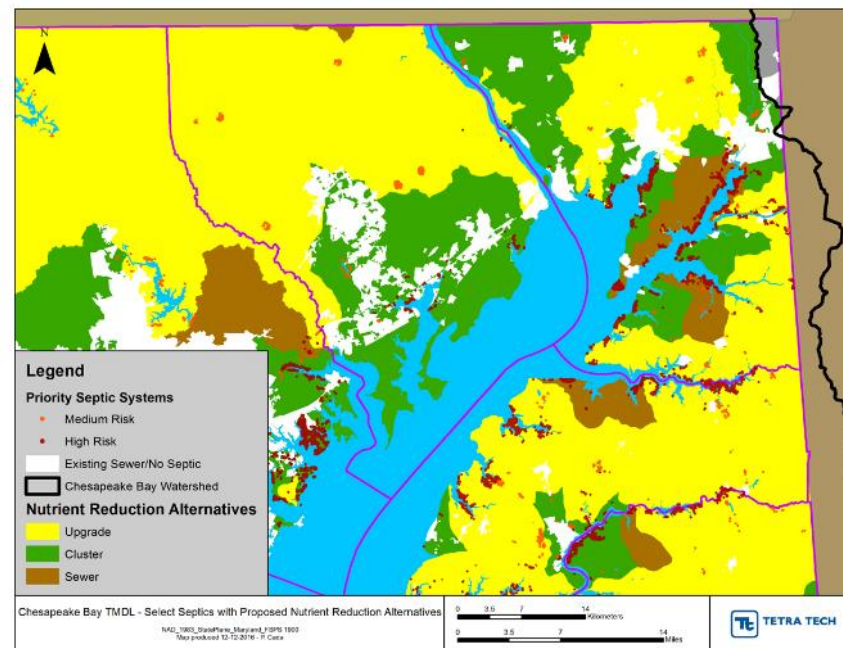

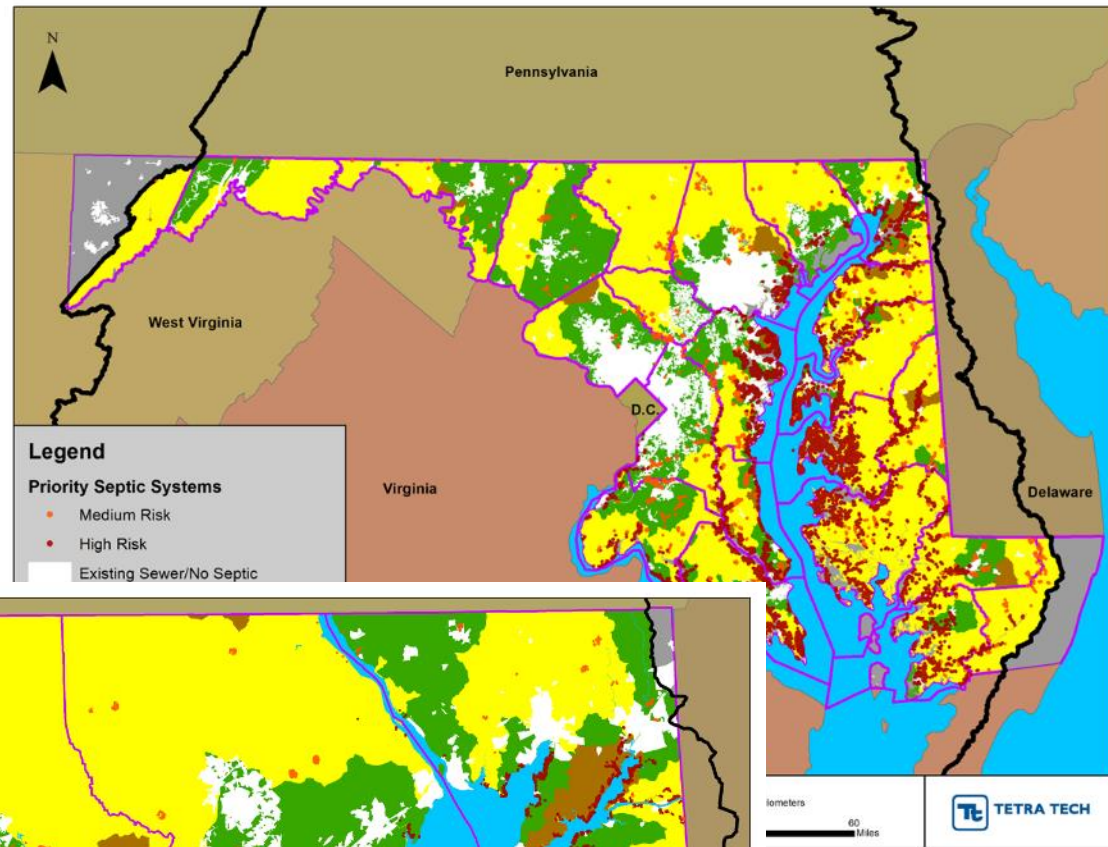

Paths Forward

- Status quo
 - Health Department continues permitting septic systems and privately owned and operated “cluster” systems *ad hoc*
 - Centralized sewer implemented over time
- Proactive distributed sewer management
 - **Inventory:** what do you have?
 - GIS data, permit data, field reconnaissance
 - **Prioritize** systems for improvement
 - Stakeholder goals and values
 - Indicators might include: proximity to water, soil characteristics, system age, etc.
 - **Manage:** intensity tied to risk
 - Onsite improvements, cluster systems, sewer
 - Implementation (design, installation, OM&M)
 - Capacity building

Maryland Plan for Chesapeake Bay TMDL

- Statewide plan for reducing nutrients from existing decentralized systems
 - Loading analysis
 - Reduction analysis
- Tied into State smart growth objectives
 - Onsite upgrades
 - Clustering
 - Sewering

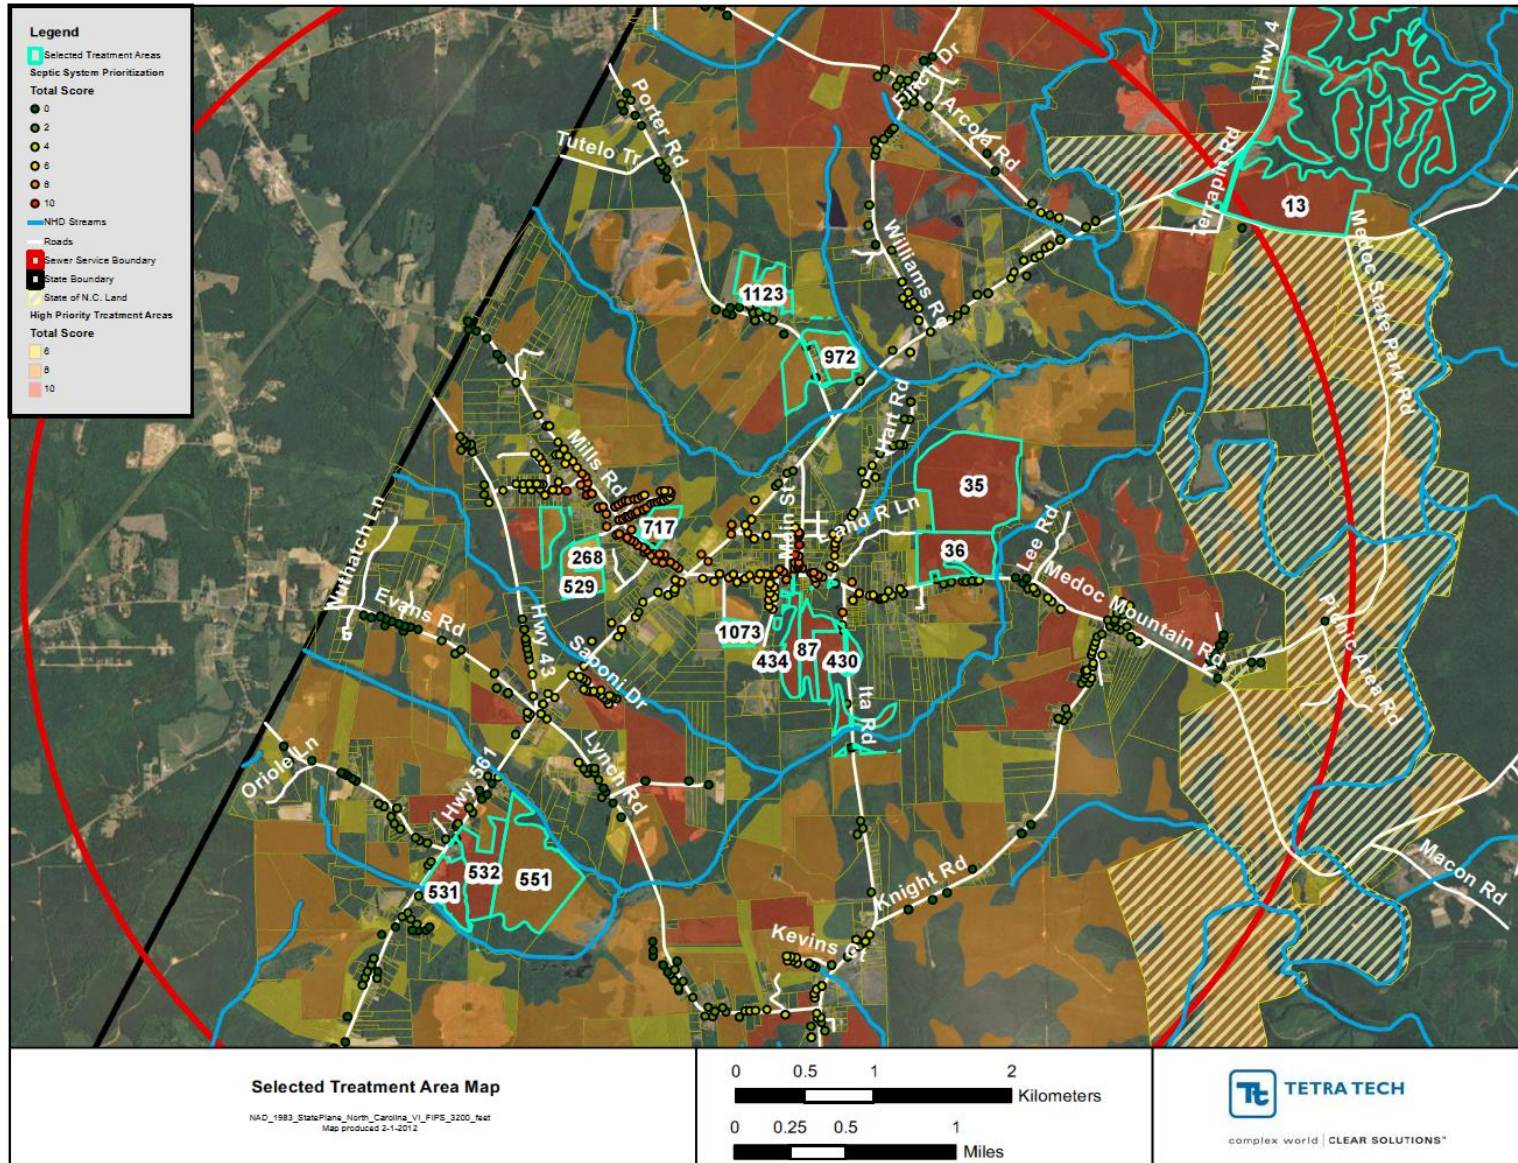

Meadows Sewer District Cluster Systems Study: *Background*

- Rural, with clusters of homes interspersed with large parcels
- ~37% non-compliant or problematic septic systems
- Minimal opportunity to grow or open businesses
- Prior engineering study recommended sewer extension
 - ~\$22,000/home capital cost;
 - ~\$95/month service fee
- Multiple stakeholders: Halifax County, Haliwa-Saponi Tribe, Hollister REACH, NC RCAP

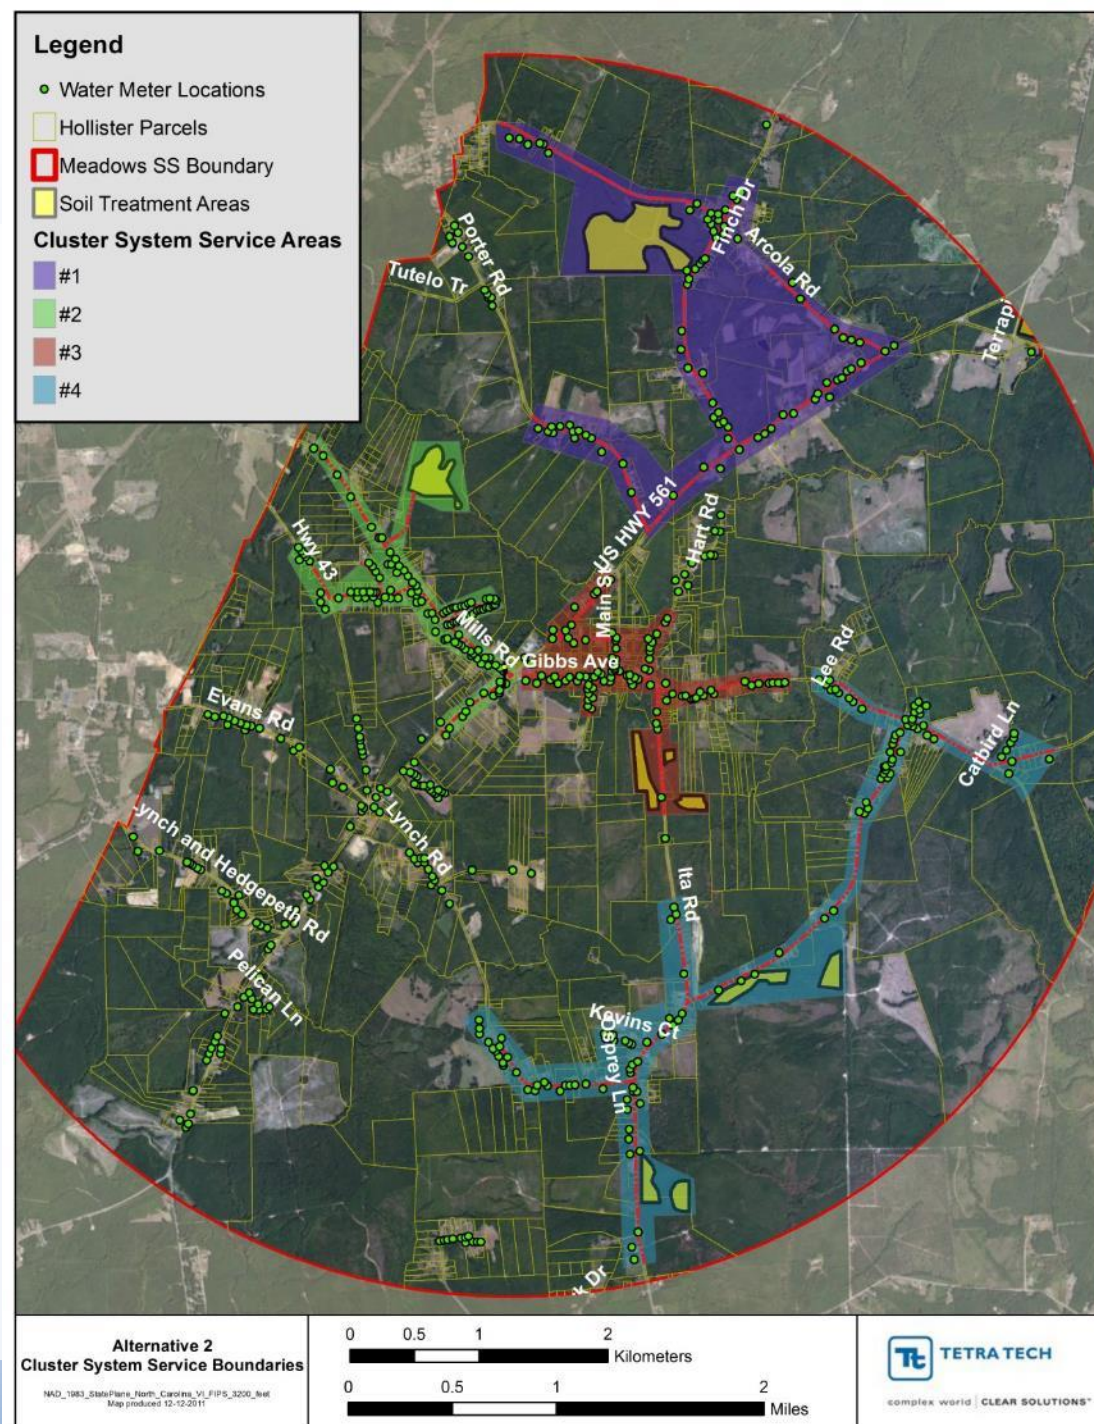

- Client: Halifax County, NC
- Funding: North Carolina Rural Economic Development Center planning grant
- Hollister, NC - disadvantaged community without public sewer

Meadows Sewer District: Parcel Prioritization Map

Meadows Sewer District: *Multiple Cluster Option*

- Large cluster treatment and dispersal systems
- STEP > Small Diameter Pressure Sewer
- Capacity can be added incrementally
- Cost effective
 - Sewer connection... \$21K/home
 - Single cluster... \$16K/home
 - **Multi-cluster... \$11K/home**
 - Smaller clusters may be less expensive

Town of Lake Santeetlah - Parcel Evaluation

AREA 1:
LRM feels this area has the possibility for multiple offsite conventional septic repairs. This area is approximately 3.5 acres. If a large cluster, or community type system needed, LRM recommends using an Aerobic Subsurface Drip Irrigation System in this area to maximize the potential design flow/bedrooms that could be permitted in this area.

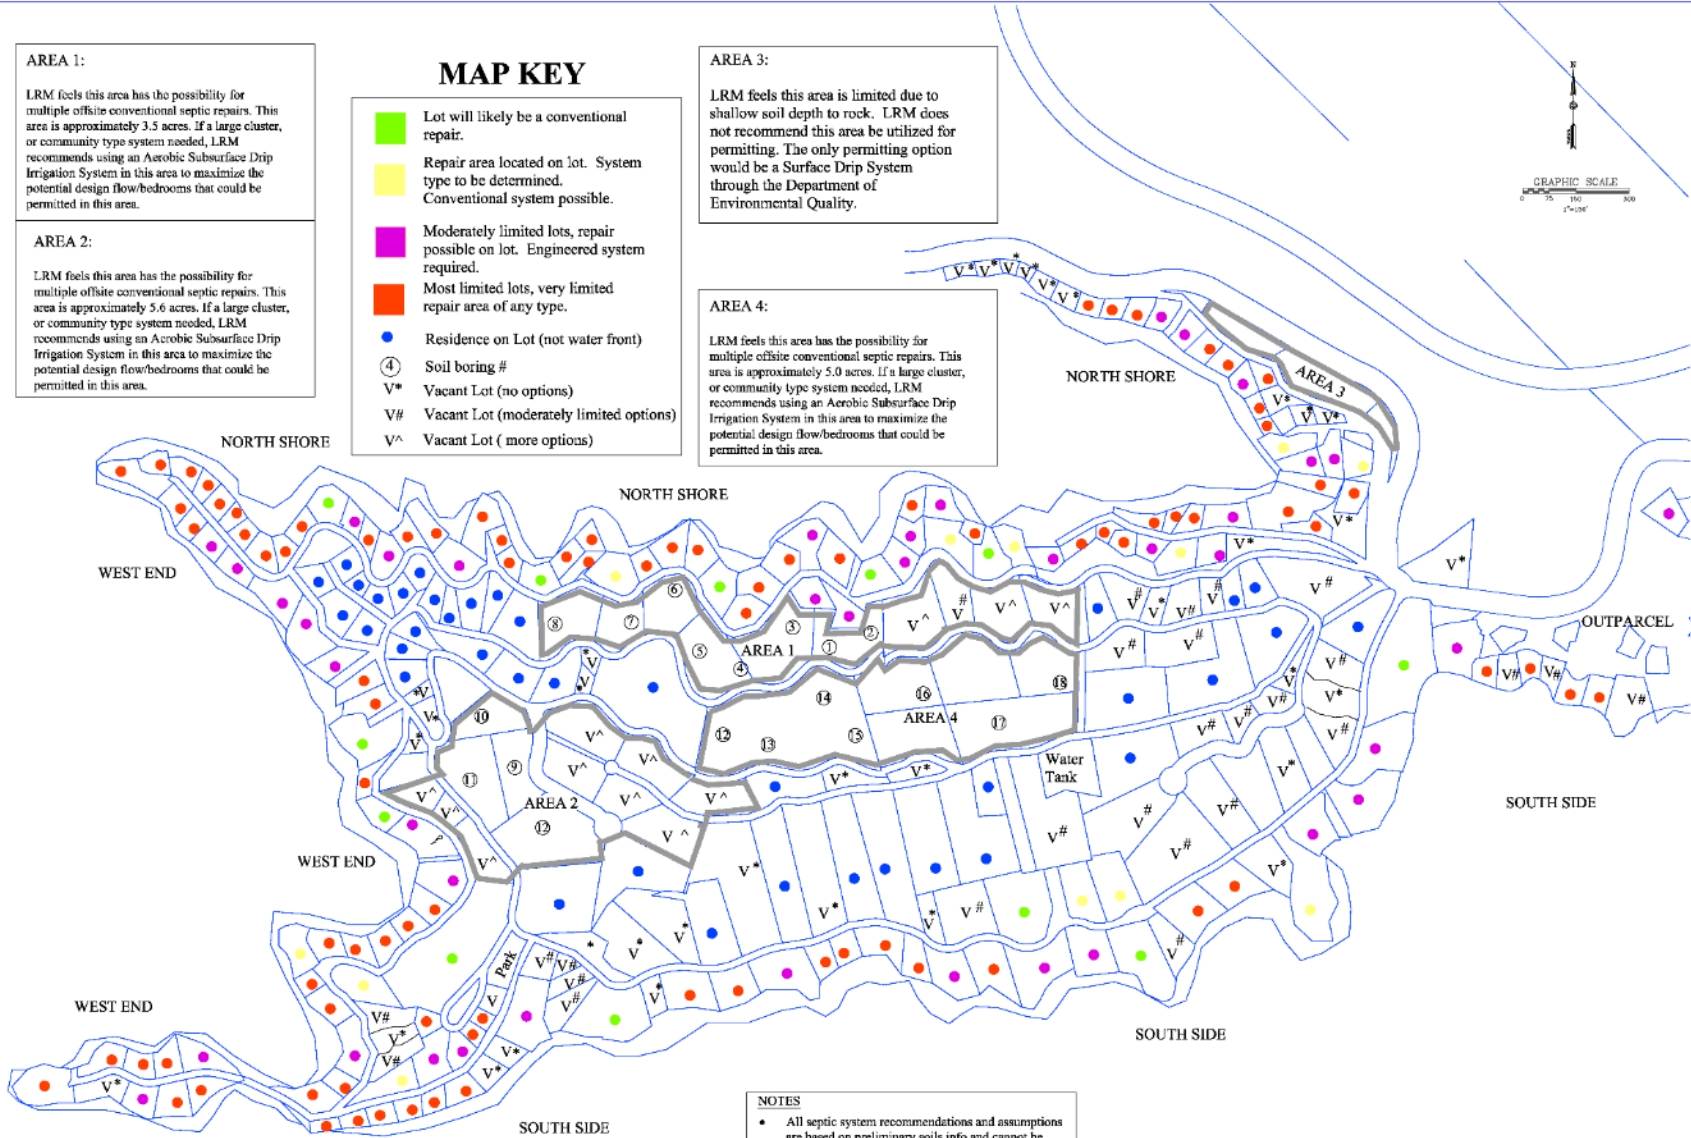

AREA 2:
LRM feels this area has the possibility for multiple offsite conventional septic repairs. This area is approximately 5.6 acres. If a large cluster, or community type system needed, LRM recommends using an Aerobic Subsurface Drip Irrigation System in this area to maximize the potential design flow/bedrooms that could be permitted in this area.

MAP KEY

- Lot will likely be a conventional repair.
- Repair area located on lot. System type to be determined. Conventional system possible.
- Moderately limited lots, repair possible on lot. Engineered system required.
- Most limited lots, very limited repair area of any type.
- Residence on Lot (not water front)
- Soil boring #
- V* Vacant Lot (no options)
- V# Vacant Lot (moderately limited options)
- V^ Vacant Lot (more options)

AREA 3:
LRM feels this area is limited due to shallow soil depth to rock. LRM does not recommend this area be utilized for permitting. The only permitting option would be a Surface Drip System through the Department of Environmental Quality.

AREA 4:
LRM feels this area has the possibility for multiple offsite conventional septic repairs. This area is approximately 5.0 acres. If a large cluster, or community type system needed, LRM recommends using an Aerobic Subsurface Drip Irrigation System in this area to maximize the potential design flow/bedrooms that could be permitted in this area.

NOTES

- All septic system recommendations and assumptions are based on preliminary soils info and cannot be guaranteed without a Licensed Soil Scientist (LSS) permit level soils evaluation.

Resources in Wastewater

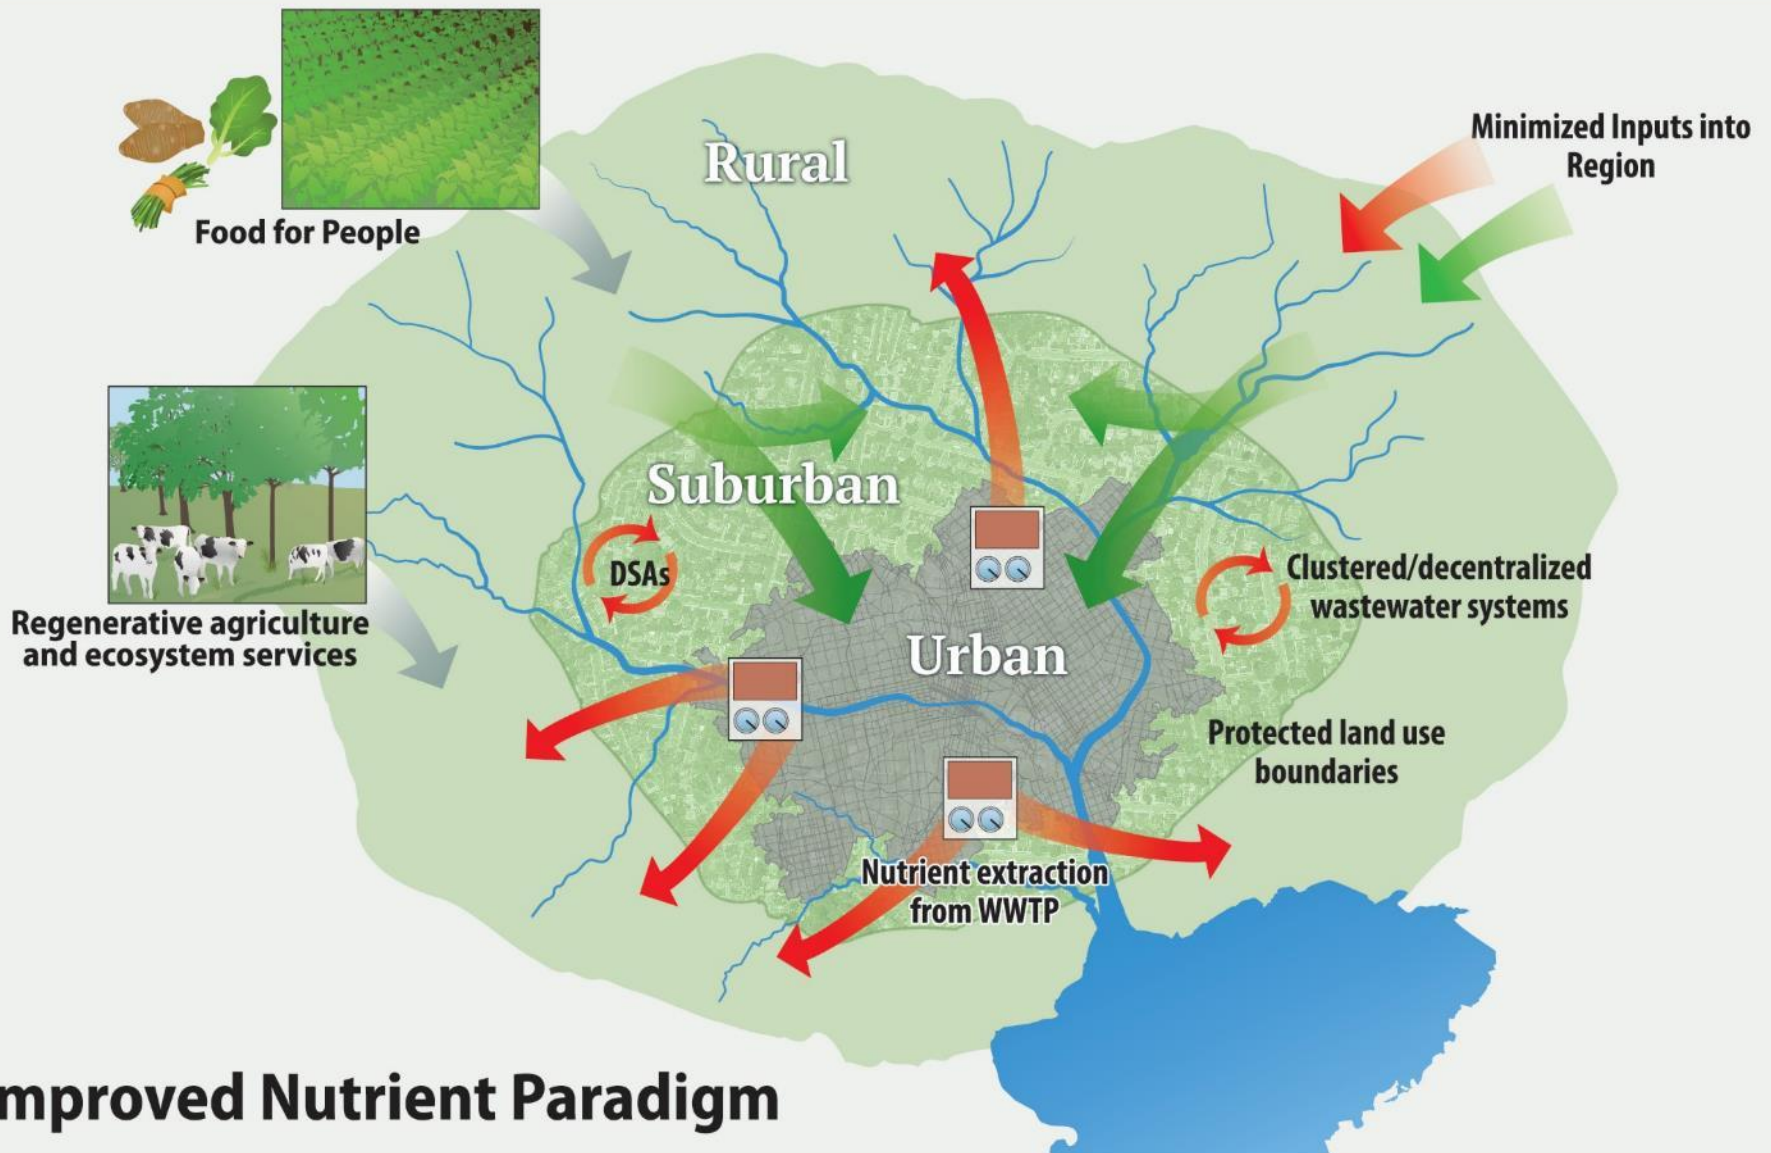

- Clean water
 - Landscape/agriculture irrigation
 - Flushing toilets
- Nutrients: nitrogen and phosphorus primarily
 - Fertilizer for landscape/agriculture
- Carbon/energy
 - Biogas for direct burning or electricity generation
 - Compost for soil amendment

An Unsustainable Model

Resilient Model Connects Rural and Urban Areas

Comp. Plan Recommendations and Contact Information

- Recognize attributes of centralized and decentralized approaches
- Recognize importance of a distributed sewer architecture
- Consider water/sewer approaches when identifying development zones
- Avoid “leapfrog” development
- Recommend distributed wastewater scoping study
